PRECAUTIONS AND PREPARATION

Special Service Tools

The actual shapes of Kent-Moore tools may differ from those of special service tools illustrated here.

Tool number (Kent-Moore No.) Tool name	Description	
(J36471-A) Front heated oxygen sensor wrench		Loosening or tightening front heated oxygen sensor
(J36470) Rear heated oxygen sensor wrench	NT379	Loosening or tightening rear heated oxygen sensor

Supplemental Restraint System (SRS) "AIR BAG"

The Supplemental Restraint System "Air Bag", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger in a frontal collision. The Supplemental Restraint System consists of air bag modules (located in the center of the steering wheel and on the instrument panel on the passenger side), a diagnosis sensor unit, warning lamp, wiring harness and spiral cable. Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death
 in the event of a collision which would result in air bag inflation, all maintenance must be performed
 by an authorized NISSAN dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses are covered with yellow insulation either just before the harness connectors or for the complete harness, for easy identification.

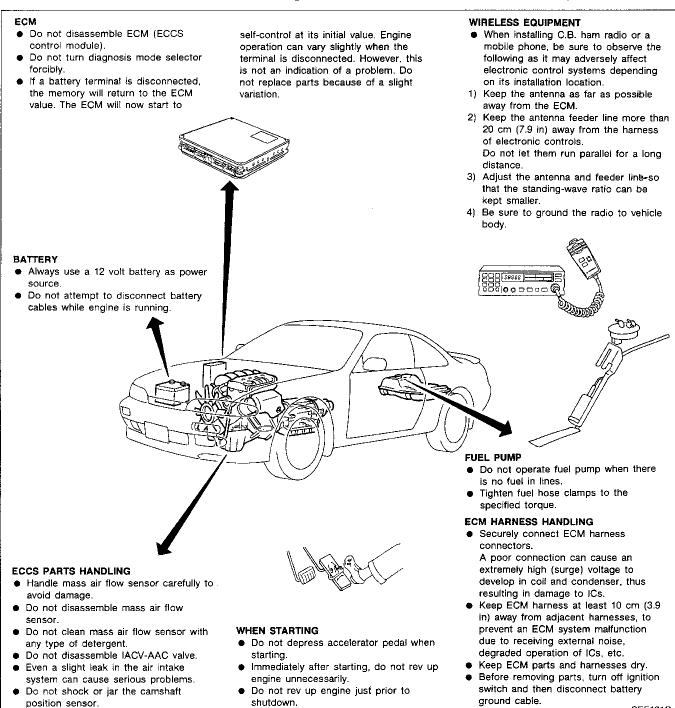

Precautions for On Board Diagnostic (OBD) System of Engine and A/T

The ECM (ECCS control module) has an on board diagnostic system. It will light up the malfunction indicator lamp (MIL) to warn the driver of a malfunction causing emission deterioration.

CAUTION:

- Be sure to turn the ignition switch "OFF" and disconnect the negative battery terminal before any
 repair or inspection work. The open/short circuit of related switches, sensors, solenoid valves, etc.
 will cause the MIL to light up.
- Be sure to connect and lock the connectors securely after work. A loose (unlocked) connector will
 cause the MIL to light up due to the open circuit. (Be sure the connector is free from water, grease,
 dirt, bent terminals, etc.)
- Be sure to route and secure the harnesses properly after work. The interference of the harness with a bracket, etc. may cause the MIL to light up due to the short circuit.
- Be sure to connect rubber tubes properly after work. A misconnected or disconnected rubber tube
 may cause the MIL to light up due to the malfunction of the EGR system or fuel injection system,
 etc.
- Be sure to erase the unnecessary malfunction information (repairs completed) from the ECM or A/T control unit before returning the vehicle to the customer.

PRECAUTIONS AND PREPARATION

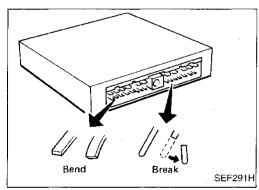

Precautions

 Before connecting or disconnecting the ECM harness connector, turn ignition switch OFF and disconnect negative battery terminal. Failure to do so may damage the ECM because battery voltage is applied to ECM even if ignition switch is turned off.

 When connecting ECM harness connector, tighten securing bolt until the gap between orange indicators disappears.

 When connecting or disconnecting pin connectors into or from ECM, take care not to damage pin terminals (bend or break).

Make sure that there are not any bends or breaks on ECM pin terminal, when connecting pin connectors.

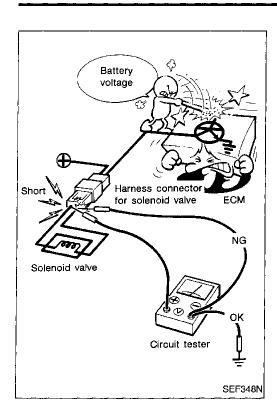

Before replacing ECM, perform ECM Terminals and Reference Value inspection and make sure ECM functions properly. Refer to EC-95.

 After performing each TROUBLE DIAGNOSIS, perform "OVERALL FUNCTION CHECK" or "DTC (Diagnostic Trouble Code) CONFIRMATION PROCEDURE". The DTC should not be displayed in the "DTC CONFIRMA-TION PROCEDURE" if the repair is completed. The "OVERALL FUNCTION CHECK" should be a good result if the repair is completed.

PRECAUTIONS AND PREPARATION

Precautions (Cont'd)

 When measuring ECM signals with a circuit tester, never allow the two tester probes to contact.
 Accidental contact of probes will cause a short circuit and damage the ECM power transistor.

ENGINE AND EMISSION CONTROL OVERALL SYSTEM

- *2: The DTC related to A/T will be sent to ECM.
- *3: This sensor is not used to control the engine system under normal conditions.
- *4: This switch will operate in place of the throttle position sensor to control EVAP parts if the sensor malfunctions.

157

]DX

Multiport Fuel Injection (MFI) System

INPUT/OUTPUT SIGNAL LINE

BASIC MULTIPORT FUEL INJECTION SYSTEM

The amount of fuel injected from the fuel injector is determined by the ECM. The ECM controls the length of time the valve remains open (injection pulse duration). The amount of fuel injected is a program value in the ECM memory. The program value is preset by engine operating conditions. These conditions are determined by input signals (for engine speed and air intake) from both the camshaft position sensor and the mass air flow sensor.

VARIOUS FUEL INJECTION INCREASE/DECREASE COMPENSATION

In addition, the amount of fuel injection is compensated for to improve engine performance under various operating conditions as listed below.

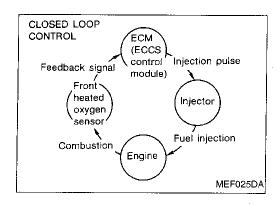

(Fuel increase)

- During warm-up
- When starting the engine
- During acceleration
- Hot-engine operation
- When selector lever is changed from "N" to "D" (A/T models only)
- High-load, high-speed operation

(Fuel decrease)

- During deceleration
- During high speed operation

158

Multiport Fuel Injection (MFI) System (Cont'd) MIXTURE RATIO FEEDBACK CONTROL

The mixture ratio feedback system provides the best air-fuel mixture ratio for driveability and emission control. The warm-up three way catalyst can then better reduce CO, HC and NOx emissions. This system uses a front heated oxygen sensor in the exhaust manifold to monitor if the engine is rich or lean. The ECM adjusts the injection pulse width according to the sensor voltage signal. For more information about front heated oxygen sensor, refer to page EC-136. This maintains the mixture ratio within the range of stoichiometric (ideal air-fuel mixture).

This stage is referred to as the closed loop control condition. Rear heated oxygen sensor is located downstream of the warm-up three way catalyst. Even if the switching characteristics of the front heated oxygen sensor shift, the air-fuel ratio is controlled to stoichiometric by the signal from the rear heated oxygen sensor.

EM

LC

OPEN LOOP CONTROL

The open loop system condition refers to when the ECM detects any of the following conditions. Feedback control stops in order to maintain stabilized fuel combustion.

FE

CL.

MIT

- Deceleration and acceleration
- High-load, high-speed operation
- Engine idling
- Malfunction of front heated oxygen sensor or its circuit
- Insufficient activation of front heated oxygen sensor at low engine coolant temperature
- High-engine coolant temperature
- During warm-up
- After shifting from "N" to "D"
- When starting the engine

PD)

RA

AT

MIXTURE RATIO SELF-LEARNING CONTROL

The mixture ratio feedback control system monitors the mixture ratio signal transmitted from the front heated oxygen sensor. This feedback signal is then sent to the ECM. The ECM controls the basic mixture ratio as close to the theoretical mixture ratio as possible. However, the basic mixture ratio is not necessarily controlled as originally designed. Both Manufacturing differences (i.e. mass air flow sensor hot wire) and characteristic changes during operation (i.e. injector clogging) directly affect mixture ratio.

Accordingly, the difference between the basic and theoretical mixture ratios is monitored in this system. This is then computed in terms of "injection pulse duration" to automatically compensate for the difference between the two ratios.

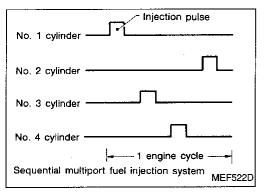

"Fuel trim" refers to the feedback compensation value compared against the basic injection duration. Fuel trim includes short-term fuel trim and long term fuel trim.

"Short term fuel trim" is the short-term fuel compensation used to maintain the mixture ratio at its theoretical value. The signal from the front heated oxygen sensor indicates whether the mixture ratio is RICH or LEAN compared to the theoretical value. The signal then triggers a reduction in fuel volume if the mixture ratio is rich, and an increase in fuel volume if it is lean.

"Long term fuel trim" is overall fuel compensation carried out longterm to compensate for continual deviation of the short-term fuel trim from the central value. Such deviation will occur due to individual engine differences, wear over time and changes in the usage environment. EC

159

1DX

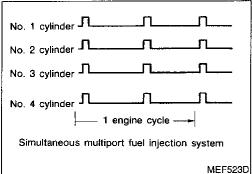

Multiport Fuel Injection (MFI) System (Cont'd) FUEL INJECTION TIMING

Two types of systems are used.

Sequential multiport fuel injection system

Fuel is injected into each cylinder during each engine cycle according to the firing order. This system is used when the engine is running.

Simultaneous multiport fuel injection system

Fuel is injected simultaneously into all four cylinders twice each engine cycle. In other words, pulse signals of the same width are simultaneously transmitted from the ECM.

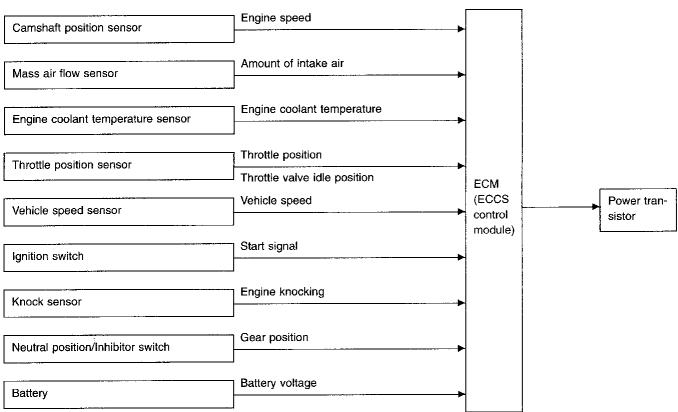

The four injectors will then receive the signals two times for each engine cycle.

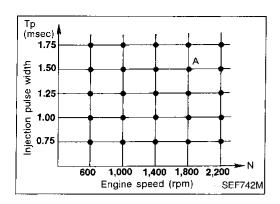

This system is used when the engine is being started and/or if the fail-safe system (CPU) is operating.

FUEL SHUT-OFF

Fuel to each cylinder is cut off during deceleration or operation of the engine at excessively high speeds.

Distributor Ignition (DI) System INPUT/OUTPUT SIGNAL LINE

Distributor Ignition (DI) System (Cont'd) SYSTEM DESCRIPTION

The ignition timing is controlled by the ECM to maintain the best air-fuel ratio for every running condition of the engine.

The ignition timing data is stored in the ECM. This data forms the map shown.

The ECM detects information such as the injection pulse width and camshaft position sensor signal. Responding to this information, ignition signals are transmitted to the power transistor.

e.g. N: 1,800 rpm, Tp: 1.50 msec A °BTDC

During the following conditions, the ignition timing is revised by the ECM according to the other data stored in the ECM.

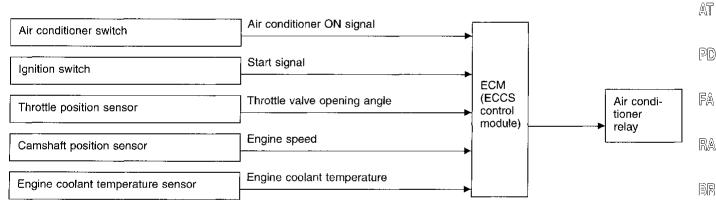

- At starting
- During warm-up
- At idle
- Hot engine operation
- During acceleration

The knock sensor retard system is designed only for emergencies. The basic ignition timing is programmed within the anti-knocking zone, if recommended fuel is used under dry conditions. The retard system does not operate under normal driving conditions. If engine knocking occurs, the knock sensor monitors the condition.

The signal is transmitted to the ECM (ECCS control module). The ECM retards the ignition timing to eliminate the knocking condition.

Air Conditioning Cut Control

INPUT/OUTPUT SIGNAL LINE

SYSTEM DESCRIPTION

This system improves engine operation when the air conditioner is used.

Under the following conditions, the air conditioner is turned off.

- · When the accelerator pedal is fully depressed.
- When cranking the engine.
- At high engine speeds.
- When the engine coolant temperature becomes excessively high.

Fuel Cut Control (at no load & high engine speed)

INPUT/OUTPUT SIGNAL LINE

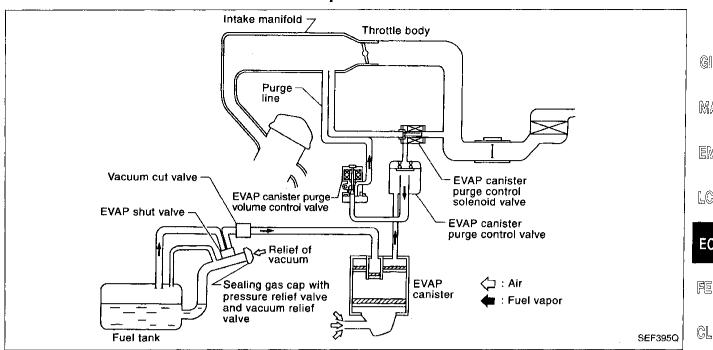

If the engine speed is above 3,000 rpm with no load (for example, in neutral and engine speed over 3,000 rpm) fuel will be cut off after some time. The exact time when the fuel is cut off varies based on engine speed.

Fuel cut will operate until the engine speed reaches 1,500 rpm, then fuel cut is cancelled.

NOTE

This function is different than deceleration control listed under multiport fuel injection on EC-14.

Description

The evaporative emission system is used to reduce hydrocarbons emitted into the atmosphere from the fuel system. This reduction of hydrocarbons is accomplished by activated charcoals in the EVAP canister.

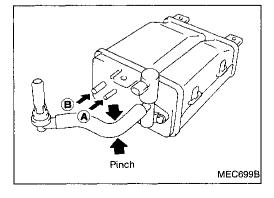

The fuel vapor in the sealed fuel tank is led into the EVAP canister which contains activated carbon and the vapor is stored there when the engine is not operating.

The vapor in the EVAP canister is purged by the air through the purge line to the intake manifold when the engine is operating.

EVAP canister purge volume control valve is controlled by engine control module. When the engine operates, the flow rate of vapor controlled by EVAP canister purge volume control valve is proportionally regulated as the air flow increases.

EVAP canister purge control valve shuts off the vapor purge line during decelerating and idling, and under normal operating conditions the valve is usually open.

EVAP shut valve shuts off the vapor charge line when fuel is being supplied to the fuel tank.

Inspection

EVAP CANISTER

Check EVAP canister as follows:

- Pinch the fresh air vent hose.
- Blow air in port (A) and check that it flows freely out of port (B).

Inspection (Cont'd)

TIGHTENING TORQUE

Tighten EVAP canister as shown in the figure.

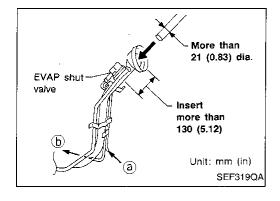

FUEL TANK VACUUM RELIEF VALVE

- 1. Wipe clean valve housing.
- 2. Suck air through the cap. A slight resistance accompanied by valve clicks indicates that valve A is in good mechanical condition. Note also that, by further sucking air, the resistance should disappear with valve clicks.
- 3. Blow air on fuel tank side and ensure that continuity of air passage exists through valve B.
- 4. If valve is clogged or if no resistance is felt, replace cap as an assembly.

CAUTION:

Use only a genuine fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.

EVAPORATIVE EMISSION (EVAP) SHUT VALVE

- When pushing down the shutter inside the fuel filler opening, the EVAP shut valve is closed.
- · When releasing the shutter, the valve is open.
- 1. Insert steel tube as shown in the figure.
- 2. Blow air from one side of the EVAP shut valve tube (a) or (b) and check that there is no air flow.

EVAP CANISTER PURGE CONTROL VALVE

Refer to EC-199.

VACUUM CUT VALVE

Evaporative Emission Line Drawing (Cont'd)

POSITIVE CRANKCASE VENTILATION

Description

This system returns blow-by gas to the intake collector.

The positive crankcase ventilation (PCV) valve is provided to conduct crankcase blow-by gas to the intake manifold.

During partial throttle operation of the engine, the intake manifold sucks the blow-by gas through the PCV valve.

Normally, the capacity of the valve is sufficient to handle any blow-by and a small amount of ventilat-

The ventilating air is then drawn from the air duct

into the crankcase. In this process the air passes through the hose connecting air inlet tubes to rocker

Under full-throttle condition, the manifold vacuum is insufficient to draw the blow-by flow through the valve. The flow goes through the hose connection in the reverse direction.

On vehicles with an excessively high blow-by, the valve does not meet the requirement. This is because some of the flow will go through the hose connection to the intake collector under all conditions.

Cruising

Acceleration

or high load

MA

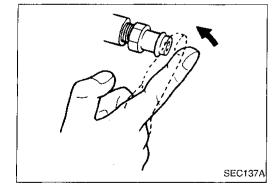

RA

Breather separator

Inspection

PCV valve

PCV (Positive Crankcase Ventilation)

⊐ · Fresh air

: Blow-by gas

With engine running at idle, remove PCV valve from breather separator. A properly working valve makes a hissing noise as air passes through it. A strong vacuum should be felt immediately when a finger is placed over the valve inlet.

PCV valve operation

Engine not running or

Idling or

decelerating

backfiring

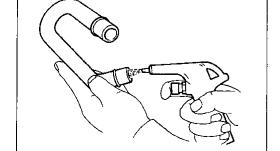

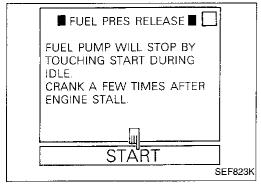

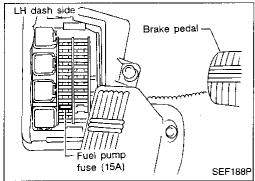

PCV HOSE

- Check hoses and hose connections for leaks.
- Disconnect all hoses and clean with compressed air. If any hose cannot be freed of obstructions, replace.

Before disconnecting fuel line, release fuel pressure from fuel line to eliminate danger.

- 1. Start engine.
- 2. Perform "FUEL PRESSURE RELEASE" in "WORK SUPPORT" mode with CONSULT. (Touch "START", and after engine stalls, crank it two or three times to release all fuel pressure.)
- 3. Turn ignition switch off.

- 1. Remove fuse for fuel pump.
- 2. Start engine.
- 3. After engine stalls, crank it two or three times to release all fuel pressure.
- 4. Turn ignition switch off and reconnect fuel pump fuse.

Fuel Pressure Check

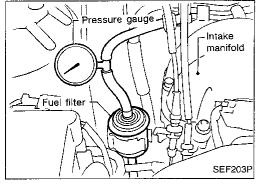

- a. When reconnecting fuel line, always use new clamps.
- b. Make sure that clamp screw does not contact adjacent parts.
- c. Use a torque driver to tighten clamps.
- d. Use Pressure Gauge to check fuel pressure.
- 1. Release fuel pressure to zero.
- 2. Disconnect fuel hose between fuel filter and fuel tube (engine side).
- 3. Install pressure gauge between fuel filter and fuel tube.
- 4. Start engine and check for fuel leakage.
- Read the indication of fuel pressure gauge.

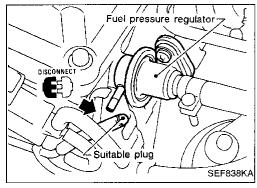

At idling:

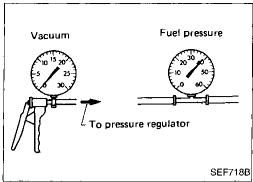

Approximately 235 kPa (2.4 kg/cm², 34 psi)
A few seconds after ignition switch is turned OFF to ON:

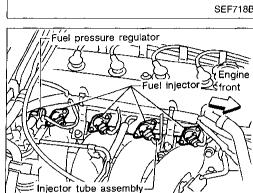

Approximately 294 kPa (3.0 kg/cm², 43 psi)

- Stop engine and disconnect fuel pressure regulator vacuum hose from intake manifold.
- 7. Plug intake manifold with a rubber cap.
- 8. Connect variable vacuum source to fuel pressure regulator.

Fuel Pressure Check (Cont'd)

9. Start engine and read indication of fuel pressure gauge as vacuum is changed.

Fuel pressure should decrease as vacuum increases. If results are unsatisfactory, replace fuel pressure regulator.

MA

Injector Removal and Installation

Release fuel pressure to zero.

EC

- Remove injector tube assembly with injectors from intake manifold.
- 3. Remove injectors from injector tube assembly.
- Push injector tail piece.
- Do not pull on the connector.
- 4. Install injectors as follows:
- 1) Clean exterior of injector tail piece.
- 2) Use new O-rings.

居

CAUTION:

SEF189PA

After properly connecting injectors to fuel tube assembly, check connections for fuel leakage.

5. Assemble injectors to injector tube assembly.

Install injector tube assembly to intake manifold.

Idle Speed/Ignition Timing/Idle Mixture Ratio Adjustment

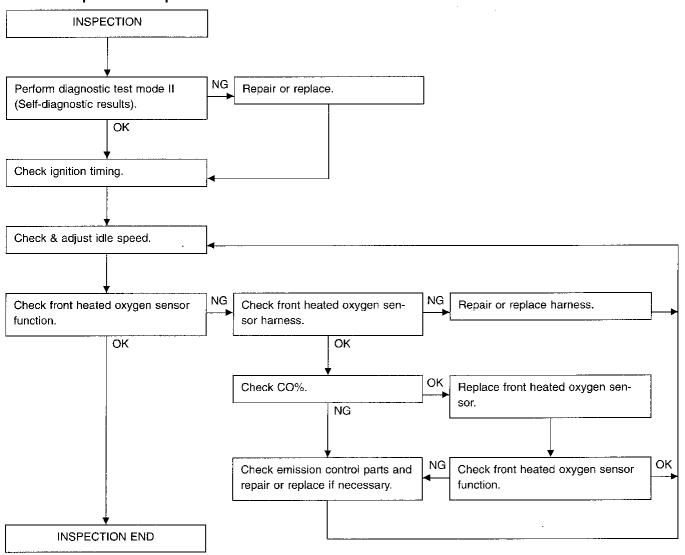

PREPARATION

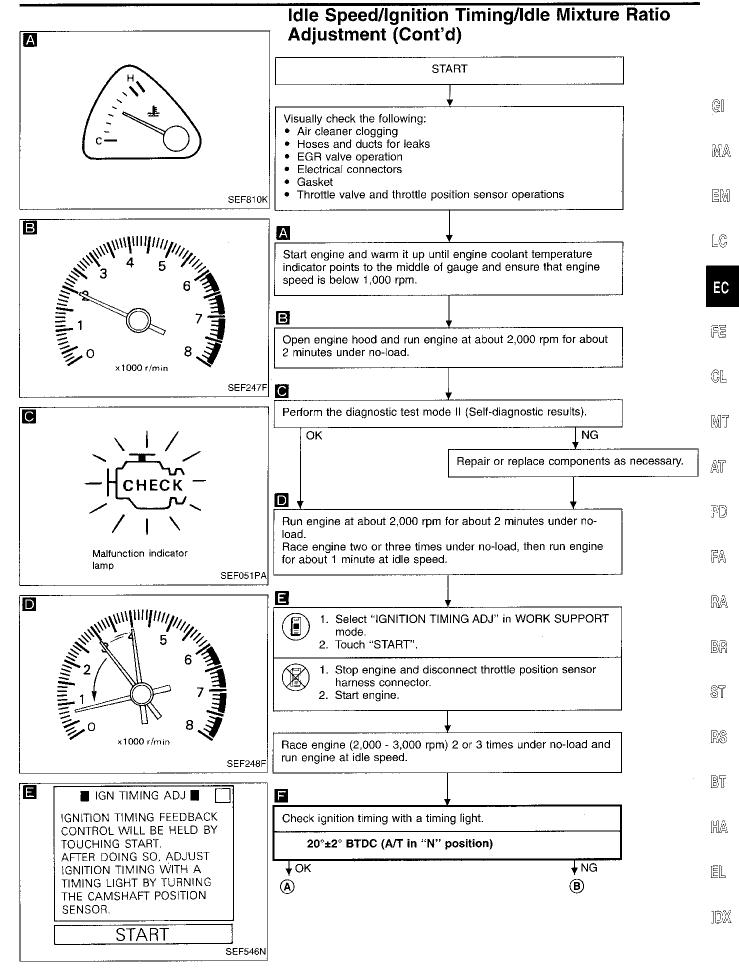

- Make sure that the following parts are in good order.
- (1) Battery
- (2) Ignition system
- (3) Engine oil and coolant levels
- (4) Fuses
- (5) ECM harness connector
- (6) Vacuum hoses
- (7) Air intake system (Oil filler cap, oil level gauge, etc.)
- (8) Fuel pressure
- (9) Engine compression
- (10)EGR valve operation
- (11)Throttle valve

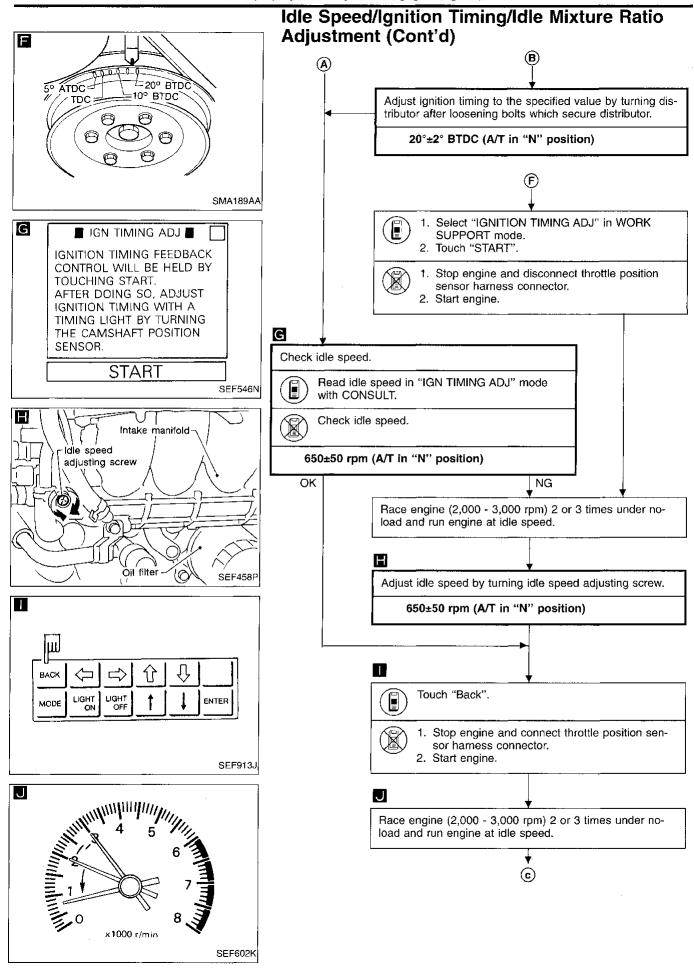

(12)Evaporative emission (EVAP) canister purge control valve

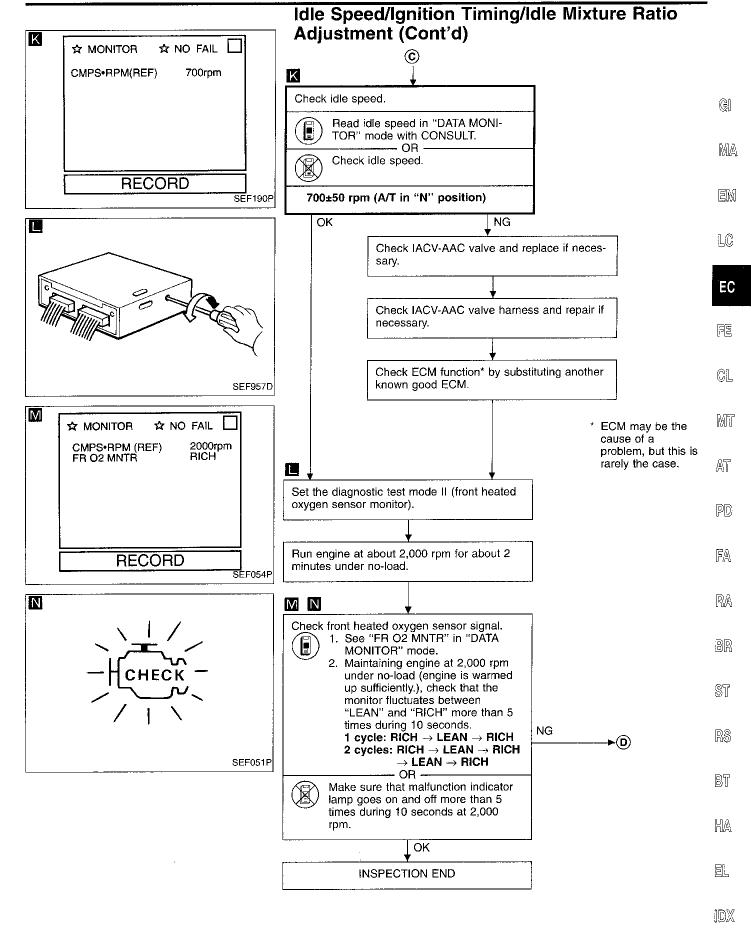

- On air conditioner equipped models, checks should be carried out while the air conditioner is "OFF".
- When checking idle speed, ignition timing and mixture ratio of A/T models, shift lever to "N" position.
- When measuring "CO" percentage, insert probe more than 40 cm (15.7 in) into tail pipe.
- Turn off headlamps, heater blower, rear defogger.
- Keep front wheels pointed straight ahead.
- Make the check after the cooling fan has stopped.

Overall inspection sequence

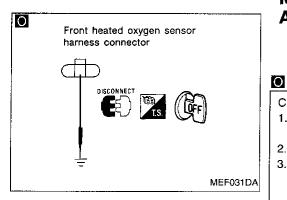

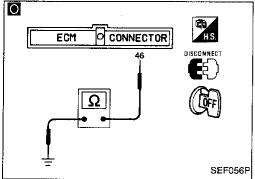

173

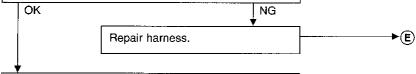

Idle Speed/Ignition Timing/Idle Mixture Ratio Adjustment (Cont'd)

Check front heated oxygen sensor harness:

- Turn off engine and disconnect battery ground cable.
- 2. Disconnect ECM harness connector from ECM
- Disconnect front heated oxygen sensor harness connector and connect terminal for front heated oxygen sensor to ground with a jumper wire.
- Check for continuity between terminal 46 of ECM harness connector and ground metal on vehicle body.

Continuity exists ... OK Continuity does not exist ... NG

- Select "ENG COOLANT TEMP" in "ACTIVE TEST" mode.
- 2. Set "COOLANT TEMP" at 20°C (68°F).

Connect ECM harness connector to ECM.

- Disconnect engine coolant temperature sensor harness connector.
- Connect a resistor (2.5 kΩ) between terminals of engine coolant temperature sensor harness connector.

Start engine and warm it up until engine coolant temperature indicator points to the middle of gauge. (Be careful to start engine after setting "COOLANT TEMP" or installing a 2.5 k Ω resistor.)

Race engine two or three times under no-load then run engine at idle speed.

Idle Speed/Ignition Timing/Idle Mixture Ratio Adjustment (Cont'd) Check "CO"%. G Idle CO: Less than 7% and engine runs smoothly. After checking "CO"% MA 1. Touch "BACK". EM 1. Disconnect the resistor from terminals of engine coolant temperature sensor. 2. Connect engine coolant temperature sensor harness connector to engine coolant temperature sen-LC NG OK EC Replace front heated oxygen sensor, set the diagnostic test mode II (Front heated oxygen sensor monitor) and make sure that malfunction indicator lamp goes on and off more than 5 times during 厖 10 seconds. (2,000 rpm, no-load) NG OK CL (F) MT Connect front heated oxygen sensor harness connector to front heated oxygen sensor. AT Check fuel pressure regulator. PD Check mass air flow sensor. FA Check injector and clean or replace if necessary. RA Check engine coolant temperature sensor. BR ST Check ECM function* by substituting another known good ECM. RS (E) *: ECM may be the cause of a problem, but this is rarely the BT case. HA EL

175

Introduction

The ECM (ECCS control module) has an on board diagnostic system, which detects engine system malfunctions related to sensors or actuators. The malfunction indicator lamp (MIL) on the instrument panel lights up when the same malfunction is detected in two consecutive trips (Two Trip Detection Logic).

Two Trip Detection Logic

When a malfunction is detected for the first time, the malfunction (DTC and freeze frame data) is stored in the ECM memory. (1st trip) The malfunction indicator lamp will not light up at this stage.

If the same malfunction is detected during the next drive, this second detection causes the malfunction indicator lamp to light up. (2nd trip) Specific on board diagnostic items will light up or blink the MIL even in the 1st trip as below.

		MiL		
Items	1st trip		2nd trip lighting up	
		Lighting up		
Misfire (Possible three way catalyst damage)— DTC: P0300-P0304 (0701-0605) is being detected	Х			
Misfire (Possible three way catalyst damage)— DTC: P0300-P0304 (0701-0605) has been detected		X		
Three way catalyst function — DTC: P0420 (0702)		X		
Closed loop control — DTC: P0130 (0307)		Х		
Except above			Х	

The "trip" in the "Two Trip Detection Logic" means performing of the "DTC Confirmation Procedure".

HOW TO READ DTC

Diagnostic Trouble Code (DTC)

The diagnostic trouble code can be read by the following methods.

(Either code for the 1st trip or the 2nd trip can be read.)

- 1. The number of blinks of the malfunction indicator lamp in the Diagnostic Test Mode II (Self-Diagnostic Results) Examples: 0101, 0201, 1003, 1104, etc. These DTCs are controlled by NISSAN.
- CONSULT or GST (Generic Scan Tool) Examples: P0340, P1320, P0705, P0750, etc. These DTCs are prescribed by SAE J2012. (CONSULT also displays the malfunctioning component or system.)
- Output of the trouble code means that the indicated circuit has a malfunction. However, in case of the Mode II and GST they do not indicate whether the malfunction is still occurring or occurred in the past and returned to normal.

CONSULT can identify them. Therefore, using CONSULT (if available) is recommended.

HOW TO ERASE DTC

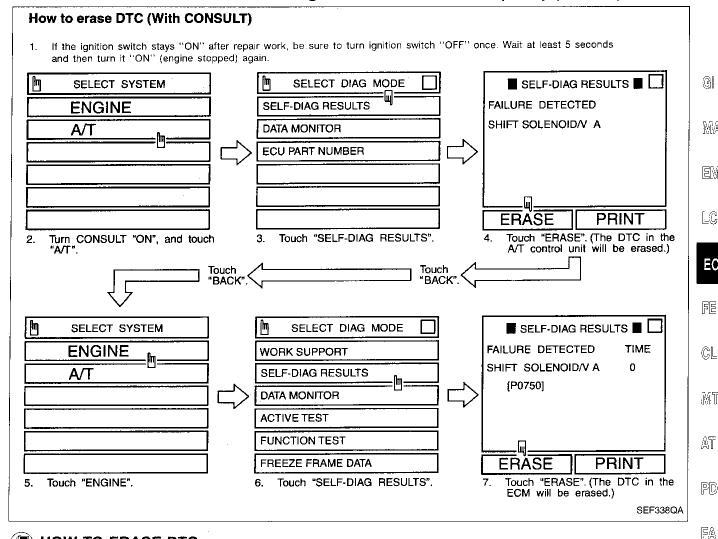

The diagnostic trouble code can be erased by the following methods.

- Selecting "ERASE" in the "SELF DIAG RESULTS" mode with CONSULT.
- (Selecting Mode 4 with GST (Generic Scan Tool).
- (NO) Changing the diagnostic test mode from Diagnostic Test Mode II to Mode I by turning the mode selector on the ECM. (Refer to EC-36.)
- If the battery terminal is disconnected, the diagnostic trouble code will be lost within 24 hours.
- When you erase the DTC, using CONSULT or GST is easier and quicker than switching the mode selector on the ECM.

()HOW TO ERASE DTC

- If a DTC is displayed for both ECM and A/T control unit, it needs to be erased for both ECM and
- If diagnostic trouble code is not for A/T related items (refer to EC-80), skip steps 2 through 4.
- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait for at least 5 seconds and then turn it "ON" (engine stopped) again.
- 2. Turn CONSULT "ON" and touch "A/T".
- 3. Touch "SELF-DIAG RESULTS".
- 4. Touch "ERASE". (The DTC in the A/T control unit will be erased.) Touch "BACK" twice.5. Touch "ENGINE".
- 6. Touch "SELF-DIAG RESULTS".
- 7. Touch "ERASE". (The DTC in the ECM will be erased.)

Diagnostic Trouble Code (DTC) (Cont'd)

(靈) HOW TO ERASE DTC

- If the diagnostic trouble code is not for A/T related items (refer to EC-80), skip step 2.
- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait for at least 5 seconds and then turn it "ON" (engine stopped) again.
- 2. Perform "SELF-DIAGNOSTIC PROCEDURE (Without CONSULT)" in AT section titled "TROUBLE DIAGNOSIS", "Self-diagnosis". (The engine warm-up step can be skipped when performing the diagnosis only to erase the DTC.)
- 3. Select Mode 4 with GST (Generic Scan Tool).

(NO) HOW TO ERASE DTC

- If the diagnostic trouble code is not for A/T related items (refer to EC-80), skip step 2.
- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait for at least 5 seconds and then turn it "ON" again.
- 2. Perform "SELF-DIAGNOSTIC PROCEDURE (Without CONSULT)" in AT section titled "TROUBLE DIAGNOSIS", "Self-diagnosis". (The engine warm-up step can be skipped when performing the diagnosis only to erase the DTC.)
- FIA 3. Change the diagnostic test mode from Mode II to Mode I by turning the mode selector on the ECM. (See page EC-36.)

Freeze Frame Data

The ECM has a memory function which stores the driving condition at the moment the ECM detects a malfunction. This includes fuel system status, calculated load value, engine coolant temperature, short fuel trim, long fuel trim, engine speed, vehicle speed.

Stored data is called Freeze Frame Data.

The data is useful for tracking down conditions at the time of the malfunction. Such conditions include whether

177

61

MA

国

[_(C

EC

FE

MT

ΔT

ST

EL

Freeze Frame Data (Cont'd)

vehicle was running or stopped, engine warm up, air-fuel ratio, etc.

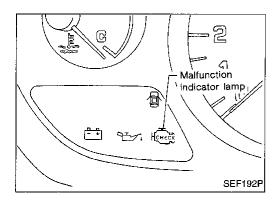

This data can be utilized to duplicate the malfunction and to diagnose the trouble.

The data will be erased along with the diagnostic trouble code by the above-mentioned method.

The data can be stored only for the 1st trip. It can not be renewed even at the 2nd trip. The freeze frame data can be stored for only one item. Therefore, the ECM has the following priorities to update the data.

Priority	Detected items
1	Misfires — DTC: P0300-P0304 (0701-0605) Fuel Injection System Function — DTC: P0172 (0114), P0171 (0115)
2	Except the above items (includes A/T items)

For example, an EGR malfunction (Priority: 2) was detected and the freeze frame data was stored at the 1st trip. After that, misfire (Priority: 1) is detected in another trip, and freeze frame data is updated from the EGR malfunction for the misfire.

Malfunction Indicator Lamp (MIL)

- The malfunction indicator lamp will light up when the ignition switch is turned ON without the engine running. This is a bulb check.
- If the malfunction indicator lamp does not light up, refer to WARNING LAMPS AND CHIME in EL section (or see EC-322).
- When the engine is started, the malfunction indicator lamp should go off.

If the lamp remains on, the on board diagnostic system has detected an engine system malfunction.

ON BOARD DIAGNOSTIC SYSTEM FUNCTION

The on board diagnostic system has the following four functions.

- 1. BULB CHECK
- : This function checks the MIL bulb for damage (blown, open circuit,
- 2. MALFUNCTION WARNING
- : This is a usual driving condition. When a malfunction is detected twice (two trip detection logic), the MIL will light up to inform the driver that a malfunction has been detected.

Only the following malfunctions with light up or blink the MIL even in the

- "Misfire (Possible three way catalyst damage)"
- "Three way catalyst function"
- "Closed loop control"
- 3. SELF-DIAGNOSTIC **RESULTS**
- : This function allows diagnostic trouble codes to be read.
- GEN SENSOR MONI-TOR
- 4. FRONT HEATED OXY- : This function allows the fuel mixture condition (lean or rich), monitored by front heated oxygen sensor, to be read.

How to switch the diagnostic test (function) modes and details of the above functions are described later. (Refer to EC-36.)

Malfunction Indicator Lamp (MIL) (Cont'd) HOW TO SWITCH DIAGNOSTIC TEST MODES

Malfunction Indicator Lamp (MIL) (Cont'd)

DIAGNOSTIC TEST MODE I — BULB CHECK

In this mode, the MALFUNCTION INDICATOR LAMP on the instrument panel should stay ON. If it remains OFF, check the bulb. (Refer to WARNING LAMPS AND CHIME in EL section or see EC-322.)

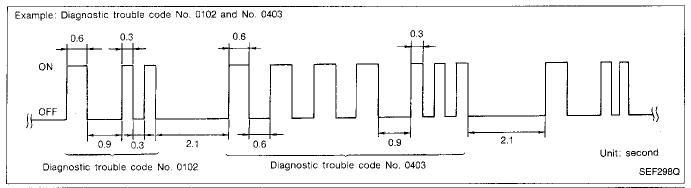

DIAGNOSTIC TEST MODE I - MALFUNCTION WARNING

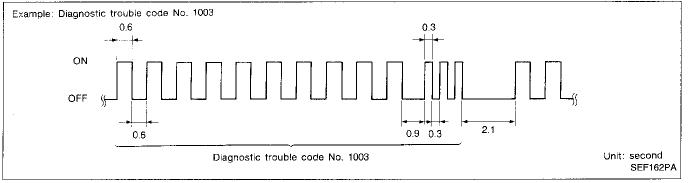

<u> </u>	The section of the se	- G[
MALFUNCTION INDICATOR LAMP	Condition	
ON	When the malfunction is detected or the ECM's CPU is malfunctioning (The "1 trip" or "2 trip" is shown in the "MIL Illumination" of the "DTC Chart". Refer to EC-66).	MA
OFF	No malfunction	. EM

 These Diagnostic Trouble Code Numbers are clarified in Diagnostic Test Mode II (SELF-DIAGNOSTIC RESULTS).

DIAGNOSTIC TEST MODE II—SELF-DIAGNOSTIC RESULTS

In this mode, a diagnostic trouble code is indicated by the number of blinks of the MALFUNCTION INDICATOR LAMP as shown below.

Long (0.6 second) blinking indicates the two LH digits of number and short (0.3 second) blinking indicates the two RH digits of number. For example, the malfunction indicator lamp blinks 10 times for 6 seconds (0.6 sec x 10 times) and then it blinks three times for about 1 second (0.3 sec x 3 times). This indicates the DTC "1003" and refers to the malfunction of the park/neutral position switch.

In this way, all the detected malfunctions are classified by their diagnostic trouble code numbers. The DTC "0505" refers to no malfunction. (See Diagnostic Trouble Code (DTC) Chart, EC-66.)

HOW TO ERASE DIAGNOSTIC TEST MODE II (Self-diagnostic results)

The diagnostic trouble code can be erased from the backup memory in the ECM when the diagnostic test mode is changed from Diagnostic Test Mode II to Diagnostic Test Mode I. (Refer to "HOW TO SWITCH DIAGNOSTIC TEST MODES".)

- If the battery terminal is disconnected, the diagnostic trouble code will be lost from the backup memory within 24 hours.
- Be careful not to erase the stored memory before starting trouble diagnoses.

Malfunction Indicator Lamp (MIL) (Cont'd)

DIAGNOSTIC TEST MODE II — FRONT HEATED OXYGEN SENSOR MONITOR

In this mode, the MALFUNCTION INDICATOR LAMP displays the condition of the fuel mixture (lean or rich) which is monitored by the front heated oxygen sensor.

MALFUNCTION INDICATOR LAMP	Fuel mixture condition in the exhaust gas	Air fuel ratio feedback control condition
ON	Lean	Closed leep system
OFF	Rich	Closed loop system
*Remains ON or OFF	Any condition	Open loop system

^{*:} Maintains conditions just before switching to open loop.

To check the front heated oxygen sensor function, start engine in the Diagnostic Test Mode II and warm it up until engine coolant temperature indicator points to the middle of the gauge.

Next run engine at about 2,000 rpm for about 2 minutes under no-load conditions. Then make sure that the MALFUNCTION INDICATOR LAMP comes ON more than 5 times within 10 seconds with engine running at 2,000 rpm under no-load.

OBD System Operation Chart

RELATIONSHIP BETWEEN MIL, DTC, CONSULT AND DETECTABLE ITEMS

- When a malfunction is detected for the first time, the DTC and the freeze frame data are stored in the ECM memory.
- When the same malfunction is detected in two consecutive trips, the MIL will come on. For details, refer
 to "Two Trip Detection Logic" on EC-32.
- The MIL will go off after the vehicle is driven 3 times with no malfunction. The drive is counted only when the recorded driving pattern is met (as stored in the ECM). If another malfunction occurs while counting, the counter will reset. The MIL will remain on until the vehicle is driven (in the recorded driving pattern) 3 times with no malfunction.
- The DTC and the freeze frame data can be displayed until the vehicle is driven 40 times (except for Misfire and Fuel Injection System, the DTC and freeze frame data can be displayed until the vehicle is driven 80 times. The "TIME" IN "SELF-DIAGNOSTIC RESULTS" mode of CONSULT will count in response to the number of times the vehicle is driven.

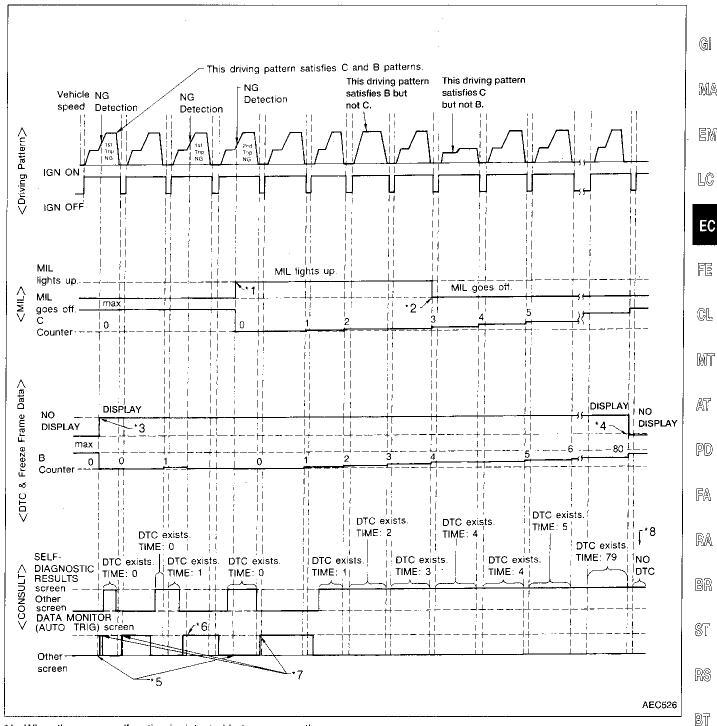

SUMMARY CHART

Items	MIL (goes off)	DTC, Freeze Frame Data (no display)
Fuel Injection System	3 (pattern C)	80 (pattern B)
Misfire	3 (pattern C)	80 (pattern B)
Except the aboves	3 (pattern B)	40 (pattern A)

Details about patterns "A", "B", and "C" are on EC-40.

OBD System Operation Chart (Cont'd)

RELATIONSHIP BETWEEN MIL, DTC, CONSULT AND DRIVING PATTERNS FOR "MISFIRE" <EXHAUST QUALITY DETERIORATION>, "FUEL INJECTION SYSTEM"

- *1: When the same malfunction is detected in two consecutive trips, MIL will light up.
- *2: MIL will go off after vehicle is driven 3 times (pattern C) without any malfunctions.
- *3: When a malfunction is detected for the first time, the DTC and the freeze frame data will be stored in ECM.
- *4: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 80 times (pattern B) without the same malfunction.
 - (The DTC and the freeze frame data still remain in ECM.)
- *5: Other screen except DATA MONITOR (AUTO TRIG) can not display the malfunction.

- *6: DATA MONITOR (AUTO TRIG) can display the malfunction at the moment it is detected.
- *7: The malfunction can not be displayed because the timing to set DATA MONITOR (AUTO TRIG) screen was missed against the NG detection.
- *8: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 80 times (pattern B) without the same malfunction.

(The DTC and the freeze frame data still remain in ECM.)

EL

IDX

OBD System Operation Chart (Cont'd)

EXPLANATION FOR DRIVING PATTERNS FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

(Driving pattern A)

(Driving pattern B)

Driving pattern B means the vehicle operation as follows:

All components and systems should be monitored at least once by the OBD system.

- The B counter will reset when the malfunction is detected twice regardless of the driving pattern.
- The B counter will count the number of times driving pattern B is satisfied without the malfunction.
- The DTC will not be displayed after the B counter reaches 80.

(Driving pattern C)

Driving pattern C means the vehicle operation as follows:

- (1) Driving pattern A should be satisfied.
- (2) The following conditions should be satisfied at the same time:
 - Engine speed: (Engine speed in the freeze frame data) ±375 rpm
 - Calculated load value: (Calculated load value in the freeze frame data) x (1±0.1) [%]
 - Engine coolant temperature (T) condition:
- When the freeze frame data shows lower than 70°C (158°F), "T" should be lower than 70°C (158°F).
- When the freeze frame data shows higher than or equal to 70°C (158°F), "T" should be higher than or equal to 70°C (158°F).

Example:

If the stored freeze frame data is as follows:

Engine speed: 850 rpm, Calculated load value: 30%, Engine coolant temperature: 80°C (176°F)

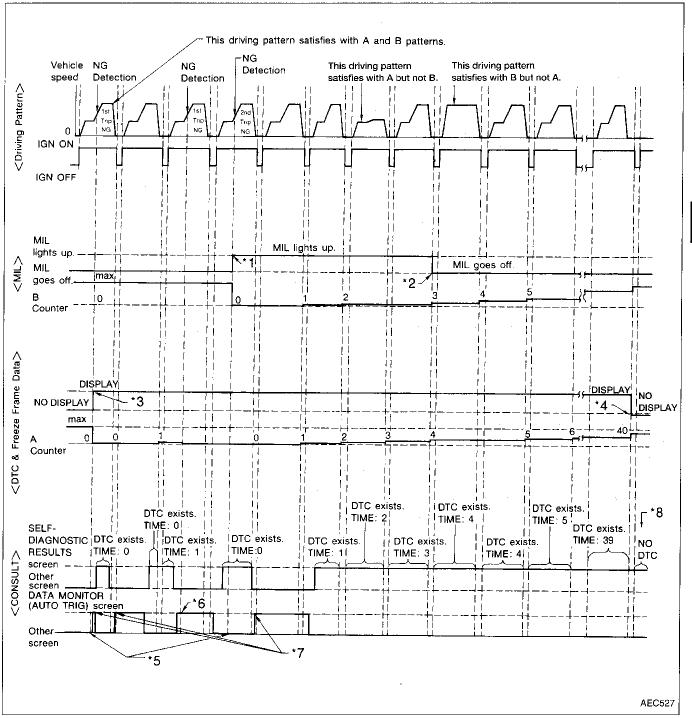

To be satisfied with driving pattern C, the vehicle should run under the following conditions:

Engine speed: 475 - 1,225 rpm, Calculated load value: 27 - 33%, Engine coolant temperature: more than 70°C (158°F)

- The C counter will be cleared when the malfunction is detected regardless of (1), (2). (*1 in "OBD SYS-TEM OPERATION CHART")
- The C counter will be counted up when (1), (2) are satisfied without the same malfunction.
- The MIL will go off when the C counter reaches 3. (*2 in "OBD SYSTEM OPERATION CHART")

OBD System Operation Chart (Cont'd)

RELATIONSHIP BETWEEN MIL, DTC, CONSULT AND DRIVING PATTERNS <u>EXCEPT</u> FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

- *1: When the same malfunction is detected in two consecutive trips, MIL will light up.
- *2: MIL will go off after vehicle is driven 3 times (pattern B) without any malfunctions.
- *3: When a malfunction is detected for the first time, the DTC and the freeze frame data will be stored in ECM.
- *4: The DTC and the freeze frame data will not be displayed after vehicle is driven 40 times (pattern A) without the same malfunction.
 - (The DTC and the freeze frame data still remain in ECM.)
- *5: Other screen except DATA MONITOR (AUTO TRIG) can not display the malfunction.

- *6: DATA MONITOR (AUTO TRIG) can display the malfunction at the moment it is detected.
- *7: The malfunction can not be displayed because the timing to set DATA MONITOR (AUTO TRIG) screen was missed against the NG detection.
- *8: The DTC and the freeze frame data will not be displayed after vehicle is driven 40 times (pattern A) without the same malfunction.
 - (The DTC and the freeze frame data still remain in ECM.)

CONSULT (Cont'd)

SELF-DIAGNOSTIC MODE

Regarding items detected in "SELF-DIAG RESULTS" mode, refer to "Diagnostic Trouble Code (DTC) chart" (See page EC-66.)

DATA MONITOR MODE

Monitored item [Unit]	ECM input signals	Main signals	Description	Remarks
CMPS·RPM (REF) [rpm]	0	0	Indicates the engine speed computed from the REF signal (180° signal) of the camshaft position sensor.	The accuracy of detection becomes poor if engine speed drops below the idle rpm. If the signal is interrupted while the engine is running, an abnormal value may be indicated.
MAS AIR/FL SE [V]	0	0	The signal voltage of the mass air flow sensor is displayed.	When the engine is stopped, a certain value is indicated.
COOLAN TEMP/S [°C] or [°F]	0	0	The engine coolant temperature (determined by the signal voltage of the engine coolant temperature sensor) is displayed.	When the engine coolant temperature sensor is open or short-circuited, ECM enters fail-safe mode. The engine cool- ant temperature determined by the ECM is displayed.
FR O2 SENSOR [V]	0	0	 The signal voltage of the front heated oxygen sensor is displayed. 	
RR O2 SENSOR [V]	0	0	The signal voltage of the rear heated oxygen sensor is displayed.	
FR O2 MNTR [RICH/LEAN]	0	0	Display of front oxygen sensor signal during air-fuel ratio feedback control: RICH means the mixture became "rich", and control is being affected toward a leaner mixture. LEAN means the mixture became "lean", and control is being affected toward a rich mixture.	 After turning ON the ignition switch, "RICH" is displayed until air-fuel mixture ratio feedback control begins. When the air-fuel ratio feedback is clamped, the value just before the clamping is displayed continuously.
RR O2 MNTR [RICH/LEAN]	0		Display of rear heated oxygen sensor signal: RICH means the amount of oxygen downstream three way catalyst is relatively large. LEAN means the amount of oxygen downstream three way catalyst is relatively small.	When the engine is stopped, a certain value is indicated. .
VHCL SPEED SE [km/h] or [mph]	0	0	The vehicle speed computed from the vehicle speed sensor signal is displayed.	

NOTE:

Any monitored item that does not match the vehicle being diagnosed is deleted from the display automatically.

ON BOARD DIAGNOSTIC SYSTEM DESCRIPTION CONSULT (Cont'd)

Monitored item [Unit]	ECM input signals	Main signals	Description	Remarks	
BATTERY VOLT [V]	Ō	0	The power supply voltage of ECM is dis- played.		-
THRTL POS SEN [V]	0	0	The throttle position sensor signal voltage is displayed.		_
Tank f/TMP se [°C] or [°F]	0		The fuel temperature judged from the tank fuel temperature sensor signal voltage is displayed.		
EGR TEMP SEN [V]	0		 The signal voltage of the EGR temperature sensor is displayed. 		-
NT/A TEMP SE [°C] or [°F]	0		 The intake air temperature determined by the signal voltage of the intake air temperature sensor is indicated. 		
START SIGNAL [ON/OFF]	0	0	 Indicates [ON/OFF] condition from the starter signal. 	After starting the engine, [OFF] is displayed regardless of the starter signal.	
CLSD THL/P SW [ON/OFF]	0	0	Indicates [ON/OFF] condition from the closed throttle position switch signal.		
AIR COND SIG [ON/OFF]	0	0	 Indicates [ON/OFF] condition of the air conditioner switch as determined by the air conditioner signal. 		•
P/N POSI SW ON/OFF]	\circ	0	 Indicates [ON/OFF] condition from the park/neutral position switch signal.

CONSULT (Cont'd)

FUNCTION TEST ITEM	CONDITION	JUDGEMENT	CHECK ITEM (REMEDY)
POWER BALANCE	 After warming up, idle the engine. Injector operation of each cylinder is stopped one after another, and resultant change in engine rotation is examined to evaluate combustion of each cylinder. (This is only displayed for models where a sequential multiport fuel injection system is used.) 	Difference in engine speed is greater than 25 rpm before and after cutting off the injector of each cylinder.	Injector circuit (Injector, harness or connector) Ignition circuit (Spark plug, power transistor, ignition coil, harness or connector) Compression Valve timing
IACV-AAC/V SYSTEM	 After warming up, idle the engine. IACV-AAC valve system is tested by detecting change in engine speed when IACV-AAC valve opening is changed to 0%, 20% and 80%. 	Difference in engine speed is greater than 150 rpm between when valve opening is at 80% and at 20%.	Harness and connector IACV-AAC valve Air passage restriction between air inlet and IACV-AAC valve IAS (Idle adjusting screw) adjustment
★EVAP (SMALL LEAK)	 After warming up, idle the engine etc. EVAP system is tested by using the evaporative gas pressure in the fuel tank or engine intake manifold pressure. 	EVAP control system has no leak. EVAP control system operates properly.	 Incorrect fuel tank vacuum relief valve Incorrect fuel filler cap used Fuel filler cap remains open or falls to close. Foreign matter caught in fuel filler cap. Leak is in line between intake manifold and EVAP canister purge control valve. Foreign matter caught in EVAP canister vent control valve. EVAP canister or fuel tank leaks EVAP purge line tube leaks EVAP purge line rubber tube to EVAP control system pressure sensor EVAP canister purge control valve EVAP canister purge control valve EVAP canister purge control valve EVAP canister purge sontrol valve EVAP canister purge control solenoid valve Absolute pressure sensor Tank fuel temperature sensor MAP/BARO switch solenoid valve Blocked or bent rubber tube to MAP/BARO switch solenoid valve

^{★:} Always select "SINGLE TEST" with CONSULT when performing the "FUNCTION TEST".

CONSULT (Cont'd)

FREEZE FRAME DATA

Freeze frame data item	Description
DIAG TROUBLE CODE [PXXXX]	ECCS component part/control system has a trouble code, it is displayed as "PXXXX". [Refer to "Alphabetical & P No. Index for DTC (EC-323).]
FUEL SYS DATA	"Fuel injection system status" at the moment a malfunction is detected is displayed. One mode in the following is displayed. "MODE 2": Open loop due to detected system malfunction "MODE 3": Open loop due to driving conditions (power enrichment, deceleration enrichment) "MODE 4": Closed loop - using oxygen sensor(s) as feedback for fuel control "MODE 5": Open loop - has not yet satisfied condition to go to closed loop
CAL/LD VALUE [%]	The calculated load value at the moment a malfunction is detected is displayed.
COOLANT TEMP [°C] or [°F]	The engine coolant temperature at the moment a malfunction is detected is displayed.
S-FUEL TRIM [%]	"Short term fuel trim" at the moment a malfunction is detected is displayed. The short-term fuel trim indicates dynamic or instantaneous feedback compensation to the base fuel schedule.
L-FUEL TRIM [%]	 "Long term fuel trim" at the moment a malfunction is detected is displayed. The long-term fuel trim indicates much more gradual feedback compensation to the base fuel schedule than short term fuel trim.
ENGINE SPEED [rpm]	The engine speed at the moment a malfunction is detected is displayed.
VHCL SPEED [km/h] or [mph]	The vehicle speed at the moment a malfunction is detected is displayed.
MAP*1 [kPa]	The intake manifold absolute pressure at the moment a malfunction is detected is displayed.

^{*1:} This item is not displayed on CONSULT. Only for Generic Scan Tool (GST).

CONSULT (Cont'd)

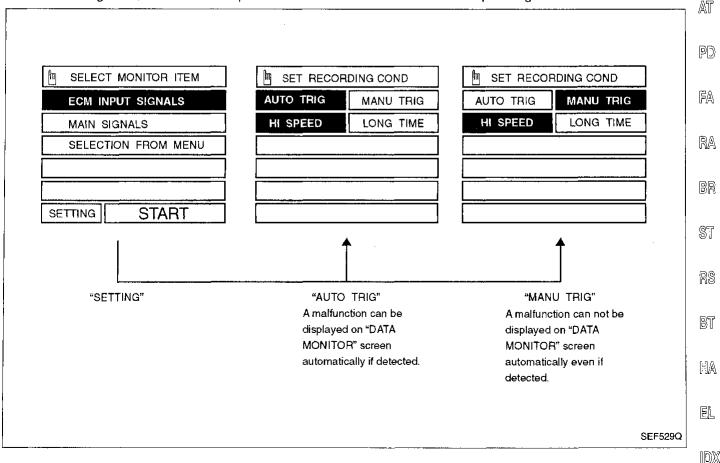

REAL TIME DIAGNOSIS IN DATA MONITOR MODE

CONSULT has two kinds of triggers and they can be selected by touching "SETTING" in "DATA MONITOR" mode.

- 1. "AUTO TRIG" (Automatic trigger):
 - The malfunction will be identified on the CONSULT screen in real time.
 In other words, DTC and malfunction item will be displayed at the moment the malfunction is detected by ECM.
 - DATA MONITOR can be performed continuously until a malfunction is detected. However, DATA MONITOR cannot continue any longer after the malfunction detection.
- 2. "MANU TRIG" (Manual trigger):
 - DTC and malfunction item will not be displayed automatically on CONSULT screen even though a malfunction is detected by ECM.
 - DATA MONITOR can be performed continuously even though a malfunction is detected.

Use these triggers as follows:

- 1. "AUTO TRIG"
 - While trying to detect the DTC by performing the "DTC CONFIRMATION PROCEDURE", be sure to select to "DATA MONITOR (AUTO TRIG)" mode. You can confirm the malfunction at the moment it is detected.
 - While narrowing down the possible causes, CONSULT should be set in "DATA MONITOR (AUTO TRIG)" mode, especially in case the incident is intermittent.
 When you are inspecting the circuit by gently shaking (or twisting) the suspicious connectors, components and harness in the "DTC CONFIRMATION PROCEDURE", the moment a malfunction is found the DTC will be displayed. (Refer to GI section, "Incident Simulation Tests" in "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT".)
- 2. "MANU TRIG"
 - If the malfunction is displayed as soon as "DATA MONITOR" is selected, reset CONSULT to "MANU TRIG". By selecting "MANU TRIG" you can monitor and store the data. The data can be utilized for further diagnosis, such as a comparison with the value for the normal operating condition.

Generic Scan Tool (GST)

DESCRIPTION

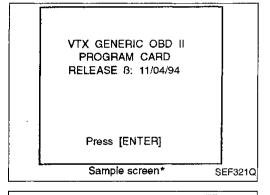

Generic Scan Tool (OBDII scan tool) complying with SAE J1978 has five different functions explained on the next page. ISO9141 is used as the protocol.

The name "GST" or "Generic Scan Tool" is used in this service manual.

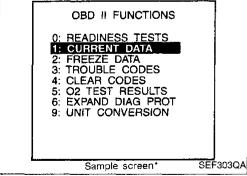

GST INSPECTION PROCEDURE

- Turn off ignition switch.
- Connect "GST" to data link connector for GST. (Data link connector for GST is located under LH dash panel near the fuse box cover.)

- 3. Turn ON ignition switch.
- 4. Enter the program according to instruction on the screen or in the operation manual.
- (*: Regarding GST screens in this section, sample screens are shown.)

 Perform each diagnostic mode according to each service procedure

For further information, see the GST Operation Manual of the tool maker.

Generic Scan Tool (GST) (Cont'd)

FUNCTION

Diagnostic test mode		Function
MODE 1	(CURRENT DATA)	This mode accesses to current emission-related data values, including analog inputs and outputs, digital inputs and outputs, and system status information.
MODE 2	(FREEZE DATA)	This mode accesses to emission-related data value which were stored by ECM during the freeze frame. [For details, refer to "Freeze Frame Data" (EC-54).]
MODE 3	(TROUBLE CODES)	This mode accesses to emission-related power train trouble codes which were stored by ECM.
MODE 4	(CLEAR CODES)	This mode can clear all emission-related diagnostic information. This includes: Clear number of diagnostic trouble codes (MODE 1) Clear diagnostic trouble codes (MODE 3) Clear trouble code for freeze frame data (MODE 1) Clear freeze frame data (MODE 2) Clear heated oxygen sensor test data (MODE 5) Reset status of system monitoring test (MODE 1)
MODE 5	(O2 TEST RESULTS)	This mode accesses to the on board heated oxygen sensor monitoring test results.

TROUBLE DIAGNOSIS — Introduction

Introduction

The engine has an ECM to control major systems such as fuel control, ignition control, idle air control system, etc. The ECM accepts input signals from sensors and instantly drives actuators. It is essential that both input and output signals are proper and stable. At the same time, it is important that there are no problems such as vacuum leaks, fouled spark plugs, or other problems with the engine.

It is much more difficult to diagnose a problem that occurs intermittently rather than continuously. Most intermittent problems are caused by poor electric connections or improper wiring. In this case, careful checking of suspected circuits may help prevent the replacement of good parts.

A visual check only may not find the cause of the problems. A road test with CONSULT (or GST) or a circuit tester connected should be performed. Follow the "Work Flow" on the next page.

Before undertaking actual checks, take a few minutes to talk with a customer who approaches with a driveability complaint. The customer can supply good information about such problems, especially intermittent ones. Find out what symptoms are present and under what conditions they occur. A "Diagnostic Worksheet" like the example on EC-59 should be used.

Start your diagnosis by looking for "conventional" problems first. This will help troubleshoot driveability problems on an electronically controlled engine vehicle.

TROUBLE DIAGNOSIS — Introduction

KEY POINTS

WHAT Vehicle & engine model WHEN Date, Frequencies WHERE Road conditions HOW Operating conditions, Weather conditions, **Symptoms**

SEF907L

Diagnostic Worksheet

There are many operating conditions that lead to the malfunction of engine components. A good grasp of such conditions can make trouble-shooting faster and more accurate.

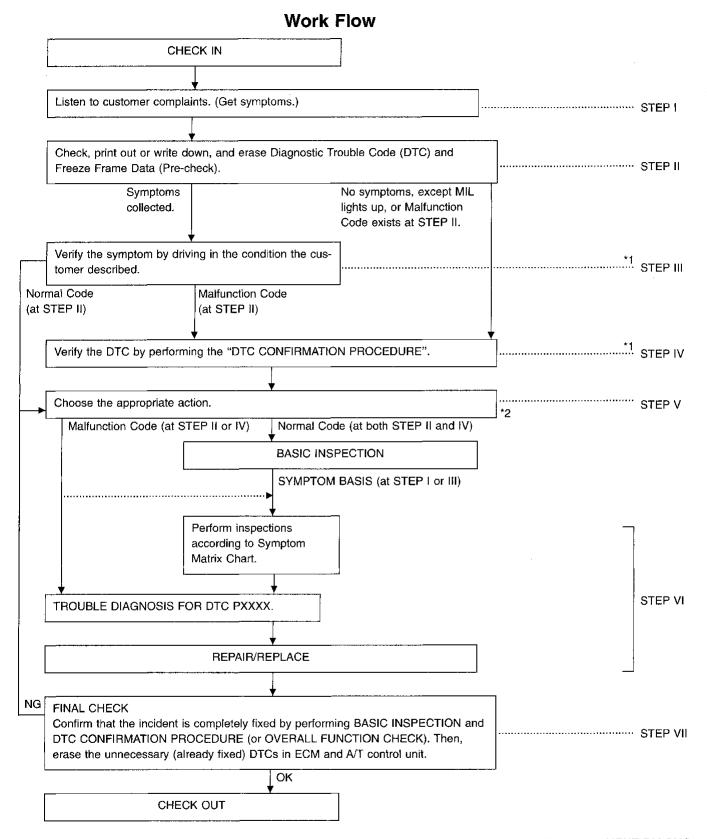

In general, each customer feels differently about a problem. It is important to fully understand the symptoms or conditions for a customer complaint.

Utilize a diagnostic worksheet like the one shown below in order to organize all the information for troubleshooting.

WORKSHEET SAMPLE

Customer name MR/MS		Model & Year	VIN			
Engine #		Trans.	Mileage			
Incident Date		Manuf. Date	In Service Date			
	☐ Startability	☐ Impossible to start ☐ No combustion ☐ Partial combustion affected by throttle ☐ Partial combustion NOT affected by th ☐ Possible but hard to start ☐ Others [position			
Symptoms	☐ Idling	☐ No fast idle ☐ Unstable ☐ High ☐ Others [idle □ Low idle			
Symptoms	☐ Driveability	☐ Stumble☐ Surge☐ Intake backfire☐ Others [□ Lack of power]			
	☐ Engine stall	☐ At the time of start ☐ While idling ☐ While accelerating ☐ Unit after stopping ☐ While loading				
Incident occurrence		☐ Just after delivery ☐ Recently ☐ In the morning ☐ At night ☐ In the daytime				
Frequency		☐ All the time ☐ Under certain conditions ☐ Sometimes				
Weather condi	tions	□ Not affected				
	Weather	☐ Fine ☐ Raining ☐ Snowing	□ Others []			
	Temperature	☐ Hot ☐ Warm ☐ Cool ☐ Co				
Engine conditions		□ Cold □ During warm-up □ After Engine speed □ □ □ 1, 0 2,000	warm-up 8			
Road conditions		☐ In town ☐ In suburbs ☐ Highwa	y □ Off road (up/down)			
Driving conditions		☐ Not affected ☐ At starting ☐ While idling ☐ At ra ☐ While accelerating ☐ While cruising ☐ While decelerating ☐ While turning (F				
Malfunction ind	icator lamp	☐ Turned on ☐ Not turned on				

[D)X(

^{*1:} If the incident cannot be duplicated, see "Incident Simulation Tests" of "HOW TO PERFORM EFFICIENT DIAGNO-SIS FOR AN ELECTRICAL INCIDENT" in GI section.

^{*2:} If the on board diagnostic system cannot be performed, check main power supply and ground circuit (See TROUBLE DIAGNOSIS FOR POWER SUPPLY EC-102).

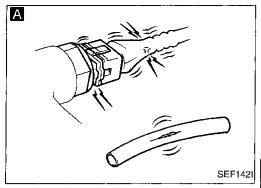

TROUBLE DIAGNOSIS — Work Flow

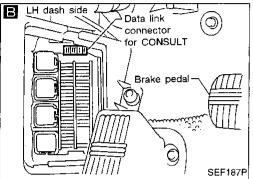

Description for Work Flow

STEP	DESCRIPTION	
STEP I	Get detailed information about the conditions and the environment when the incident/symptom occurred using the "DIAGNOSTIC WORK SHEET" as shown on the next page.	. G
STEP II	Before confirming the concern, check and write down (print out using CONSULT or Generic Scan Tool) the Diagnostic Trouble Code (DTC) and the freeze frame data, then erase the code and the data. (Refer to EC-32.) The DTC and the freeze frame data can be used when duplicating the incident at STEP III & IV. Study the relationship between the cause, specified by DTC, and the symptom described by the customer. (The "Symptom Matrix Chart" will be useful. See page EC-84.)	ĺΜ
STEP III	Try to confirm the symptom and under what conditions the incident occurs. The "DIAGNOSTIC WORK SHEET" and the freeze frame data are useful to verify the incident. Connect CONSULT to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results. If the incident cannot be verified, perform INCIDENT SIMULATION TESTS. (Refer to GI section.) If the malfunction code is detected, skip STEP IV and perform STEP V.	
STEP IV	Try to detect the Diagnostic Trouble Code (DTC) by driving in (or performing) the "DTC CONFIRMATION PROCEDURE". Check and read the DTC and freeze frame data by using CONSULT or Generic Scan Tool. During the DTC verification, be sure to connect CONSULT to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results. If the incident cannot be verified, perform INCIDENT SIMULATION TESTS. (Refer to GI section.) In case the "DTC CONFIRMATION PROCEDURE" is not available, perform the "OVERALL FUNCTION CHECK" instead. The DTC cannot be displayed by this check, however, this simplified "check" is an effective alternative. The "NG" result of the "OVERALL FUNCTION CHECK" is the same as the DTC detection.	F
STEP V	Take the appropriate action based on the results of STEP I through IV. If the malfunction code is indicated, proceed to TROUBLE DIAGNOSIS FOR DTC PXXXX. If the normal code is indicated, proceed to the BASIC INSPECTION on next page. Then perform inspections according to the Symptom Matrix Chart. (Refer to EC-84.)	M AT
STEP VI	Identify where to begin diagnosis based on the relationship study between symptom and possible causes. Inspect the system for mechanical binding, loose connectors or wiring damage using (tracing) "Harness Layouts". Gently shake the related connectors, components or wiring harness with CONSULT set in "DATA MONITOR (AUTO TRIG)" mode. Check the voltage of the related ECM terminals or monitor the output data from the related sensors with CONSULT. Refer to EC-90. The "DIAGNOSTIC PROCEDURE" in EC section contains a description based on open circuit inspection. A short circuit inspection is also required for the circuit check in the DIAGNOSTIC PROCEDURE. For details, refer to GI section ("HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT", "Circuit Inspection"). Repair or replace the malfunction parts.	P(
STEP VII	Once you have repaired the circuit or replaced a component, you need to run the engine in the same conditions and circumstances which resulted in the customer's initial complaint. Perform the "DTC CONFIRMATION PROCEDURE" and confirm the normal code (Diagnostic trouble code No. 0505 or P0000) is detected. If the incident is still detected in the final check, perform STEP VI by using a different method from the previous one. Before returning the vehicle to the customer, be sure to erase the unnecessary (already fixed) DTC in ECM and A/T control unit. (Refer to EC-32.)	BF ST

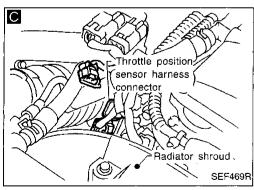

HA

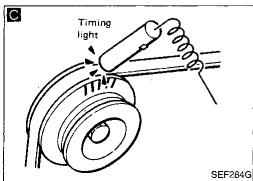

BT

IGN TIMING ADJ

Basic Inspection

Precaution:

Perform Basic Inspection without electrical or mechanical loads applied;

- Headlamp switch is OFF,
- Air conditioner switch is OFF,
- Rear defogger switch is OFF,
- Steering wheel is in the straight-ahead position, etc.

Α

BEFORE STARTING

- Check service records for any recent repairs that may indicate a related problem, or the current need for scheduled maintenance.
- 2. Open engine hood and check the following:
- Harness connectors for improper connections
- Vacuum hoses for splits, kinks, or improper connections
- Wiring for improper connections, pinches, or cuts

В

CONNECT CONSULT TO THE VEHICLE.

Connect "CONSULT" to the data link connector for CONSULT and select "ENGINE" from the menu. (Refer to page EC-43.)

CHECK IGNITION TIMING.

1. Warm up engine sufficiently.
2. Select "IGN TIMING ADJ" in

"WORK SUPPORT" mode.
3. Touch "START".
4. Check ignition timing at idle using timing light.

Ignition timing: 20°±2° BTDC

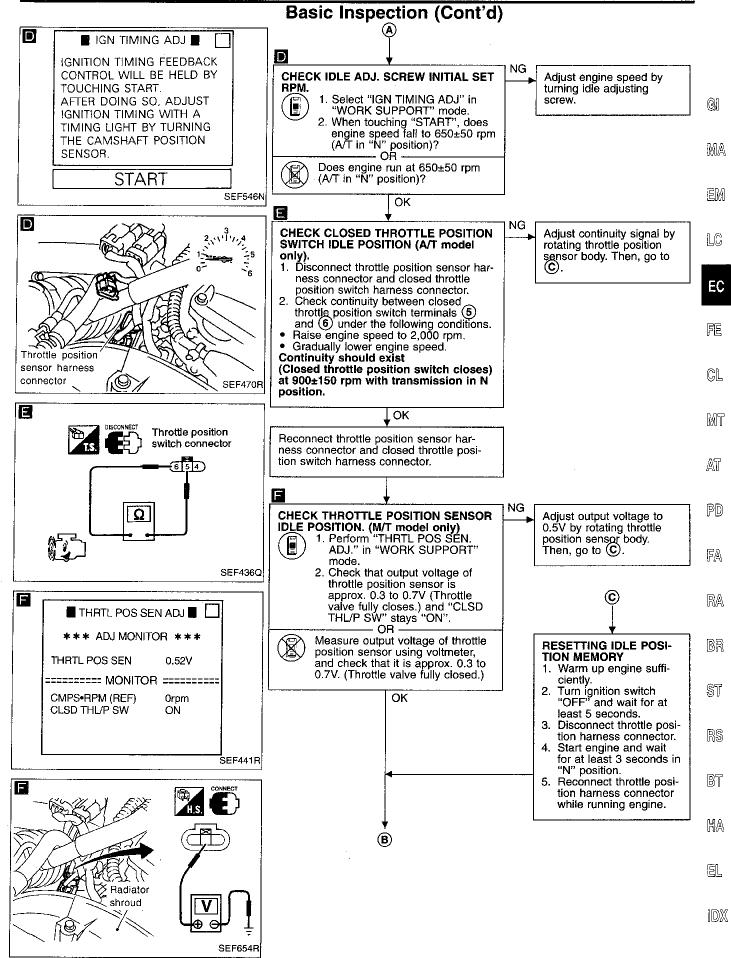

- 1. Warm up engine sufficiently.
- Stop engine and disconnect throttle position sensor harness connector.
- Start engine.
- Check ignition timing at idle using timing light. Ignition timing:

ັ20°±2° BTDC

OK

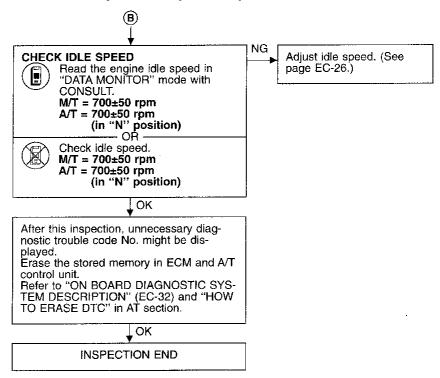

(Go to (A) on next page.)

Diagnostic Trouble Code (DTC) Chart

ENGINE RELATED ITEMS

Diagnostic trouble code No.		Detected items (Screen terms for	Malfunction is detected when
CONSULT GST	MIL	CONSULT, "SELF-DIAG RESULTS" mode)	
(P0000)	0505	No failure (NO SELF DIAGNOSTIC FAILURE INDICATED)	No malfunction related to OBD system is detected by either ECM or A/T control unit.
P0100	0102	Mass air flow sensor cir- cuit (MASS AIR FLOW SEN)	 An excessively high or low voltage is entered to ECM. Voltage sent to ECM is not practical when compared with the camshaft position sensor signal and throttle position sensor signals.
P0105	0803	Absolute pressure sensor (ABSOL PRESS SEN- SOR)	An excessively low or high voltage from the sensor is sent to ECM.
			A low voltage from the sensor is sent to ECM under heavy load driving conditions. A high voltage from the sensor is sent to ECM under light load driving conditions.
P0110	0401	Intake air temperature sensor circuit (INT AIR TEMP SEN)	An excessively low or high voltage from the sensor is detected by the ECM. Voltage sent to ECM is not practical when compared with the engine coolant temperature sensor signal.
P0115	0103	Engine coolant tempera- ture sensor circuit (COOLANT TEMP SEN)	An excessively high or low voltage from the sensor is detected by the ECM.
P0120	0403	Throttle position sensor circuit (THROTTLE POSI SEN)	 An excessively low or high voltage from the sensor is detected by the ECM. Voltage sent to ECM is not practical when compared with the mass air flow sensor and camshaft position sensor signals.
P0125	0908	Engine coolant temperature sensor function (*COOLANT TEMP SEN)	Voltage sent to ECM from the sensor is not practical, even when some time has passed after starting the engine. Engine coolant temperature is insufficient for closed loop fuel control.

Note: A dead (weak) battery will reduce the accuracy of the on board diagnosis and may cause the MIL to light up without any malfunctions.

Abbreviations for Quick Reference of "DTC CONFIRMATION PROCEDURE"

IGN: ON : Turning the ignition switch ON is required for checking the function of the sensor, switch, solenoid and circuit.

RUNNING: Running engine is required for checking the function of the sensor, switch, solenoid and circuit.

LIFTING : Lifting up the vehicle, running engine and spinning wheels are required.

DRIVING : Driving the vehicle in the specified pattern is required.

Abbreviations for Quick Reference of "OVERALL FUNCTION CHECK"

CONSULT Reference Value in Data Monitor Mode

Remarks:

- · Specification data are reference values.
- Specification data are output/input values which are detected or supplied by the ECM at the connector.
 - * Specification data may not be directly related to their components signals/values/operations.
 - i.e. Adjust ignition timing with a timing light before monitoring IGN TIMING, because the monitor may show the specification data in spite of the ignition timing not being adjusted to the specification data. This IGN TIMING monitors the data calculated by the ECM according to the signals input from the camshaft position sensor and other ignition timing related sensors.
- If the real-time diagnosis results are NG and the on board diagnostic system results are OK when diagnosing the mass air flow sensor, first check to see if the fuel pump control circuit is normal.

MONITOR ITEM	COI	NDITION	SPECIFICATION
CMPS·RPM (REF)	Tachometer: Connect Run engine and compare tachometer	r indication with the CONSULT value.	Almost the same speed as the CON- SULT value.
MAS AIR/FL SE	Engine: After warming up Air conditioner switch "OFF"	Idle	1.3 - 1.7V
IVIAG AIR/FL GE	Shift lever "N" No-load	2,000 rpm	1.7 - 2.1V
COOLAN TEMP/S	Engine: After warming up		More than 70°C (158°F)
FR O2 SENSOR			0 - 0.3V ↔ Approx. 0.6 - 1.0V
FR O2 MNTR	Engine: After warming up	Maintaining engine speed at 2,000 rpm	LEAN ↔ RICH Changes more than 5 times during 10 seconds.
RR 02 SENSOR			0 ↔ Approx. 2.2V
RR O2 MNTR	Engine: After warming up	Maintaining engine speed at 2,000 rpm	LEAN ↔ RICH
VHCL SPEED SE	Turn drive wheels and compare spee value	dometer indication with the CONSULT	Almost the same speed as the CONSULT value
BATTERY VOLT	Ignition switch: ON (Engine stopped)		11 - 14V
TUDTI DOG GEN	Ignition switch: ON	Throttle valve fully closed	0.3 - 0.7V
THRTL POS SEN	(Engine stopped)	Throttle valve fully opened	Approx. 4.0V
EGR TEMP SEN	Engine: After warming up	•	Less than 4.5V
START SIGNAL	Ignition switch: ON → START		OFF → ON
OLOD TULED ON	Ignition switch: ON	Throttle valve: Idle position	ON
CLSD THL/P SW	(Engine stopped)	Throttle valve: Slightly open	OFF
		Air conditioner switch "OFF"	OFF
AIR COND SIG	Engine: After warming up, idle the engine	Air conditioner switch "ON" (Compressor operates.)	ON
DAL DOOL OUG		Shift lever "P" or "N"	ON
P/N POSI SW	Ignition switch: ON	Except above	OFF

CONSULT Reference Value in Data Monitor Mode (Cont'd)

Major Sensor Reference Graph in Data Monitor Mode

The following are the major sensor reference graphs in "DATA MONITOR" mode. (Select "HI SPEED" in "DATA MONITOR" with CONSULT.)

THRTL POS SEN, ABSOL TH:P/S, CLSD THL/P SW

Below is the data for "THRTL POS SEN", "ABSOL TH-P/S" and "CLSD THL/P SW" when depressing the accelerator pedal with the ignition switch "ON".

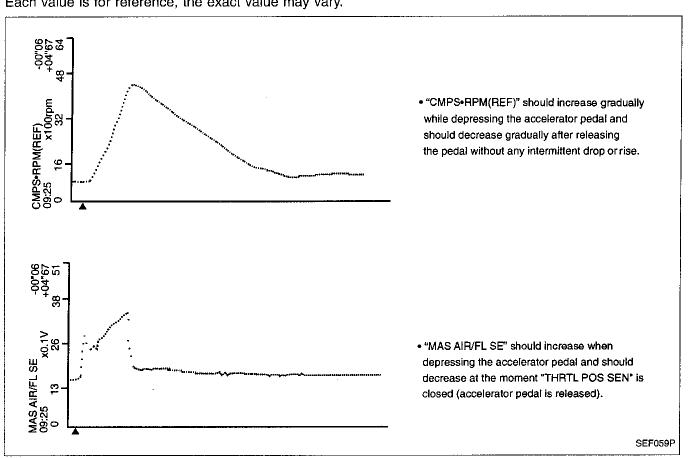

The signal of "THRTL POS SEN" and "ABSOL TH·P/S" should rise gradually without any intermittent drop or rise after "CLSD THL/P SW" is changed from "ON" to "OFF".

CMPS·RPM (REF), MAS AIR/FL SE, THRTL POS SEN, RR O2 SENSOR, FR O2 SENSOR, INJ **PULSE**

Below is the data for "CMPS·RPM (REF)", "MAS AIR/FL SE", "THRTL POS SEN", "RR O2 SENSOR", "FR O2 SENSOR" and "INJ PULSE" when revving quickly up to 4,800 rpm under no load after warming up engine sufficiently.

Each value is for reference, the exact value may vary.

Mass Air Flow Sensor (MAFS) (DTC: 0102)

The mass air flow sensor is placed in the stream of intake air. It measures the intake flow rate by measuring a part of the entire intake flow. It consists of a hot wire that is supplied with electric current from the ECM. The temperature of the hot wire is controlled by the ECM a certain amount. The heat generated by the hot wire is reduced as the intake air flows around it. The more air, the greater the heat loss.

Therefore, the ECM must supply more electric current to the hot wire as air flow increases. This maintains the temperature of the

- Turn ignition switch "ON".
- Start engine and warm it up sufficiently.
- Run engine for at least 10 seconds at idle speed.
- Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
- Perform diagnostic test mode II (Self-diagnostic results) with ECM.

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of mass air flow sensor. During this check a DTC might not be confirmed.

Procedure for malfunction C

- Turn ignition switch "ON".
- Start engine and warm it up sufficiently.
- 3) Select "DATA MONITOR" mode with CONSULT.
- Check the voltage of mass air flow sensor with "DATA MONITOR".
- Check for linear voltage rise in response to increases to about 4,000 rpm in engine speed. - OR

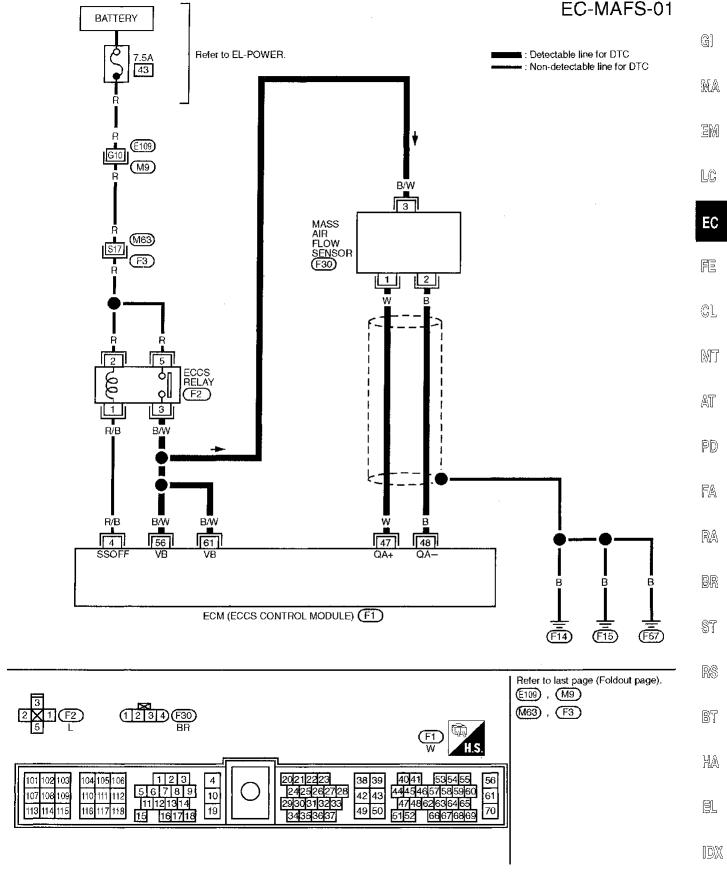

- Turn ignition switch "ON". 1)
- 2) Start engine and warm it up sufficiently.
- Select "MODE 1" with GST. 3)
- Check the mass air flow with "MODE 1". 4)
- Check for linear mass air flow rise in response to increases to about 4,000 rpm in engine speed.

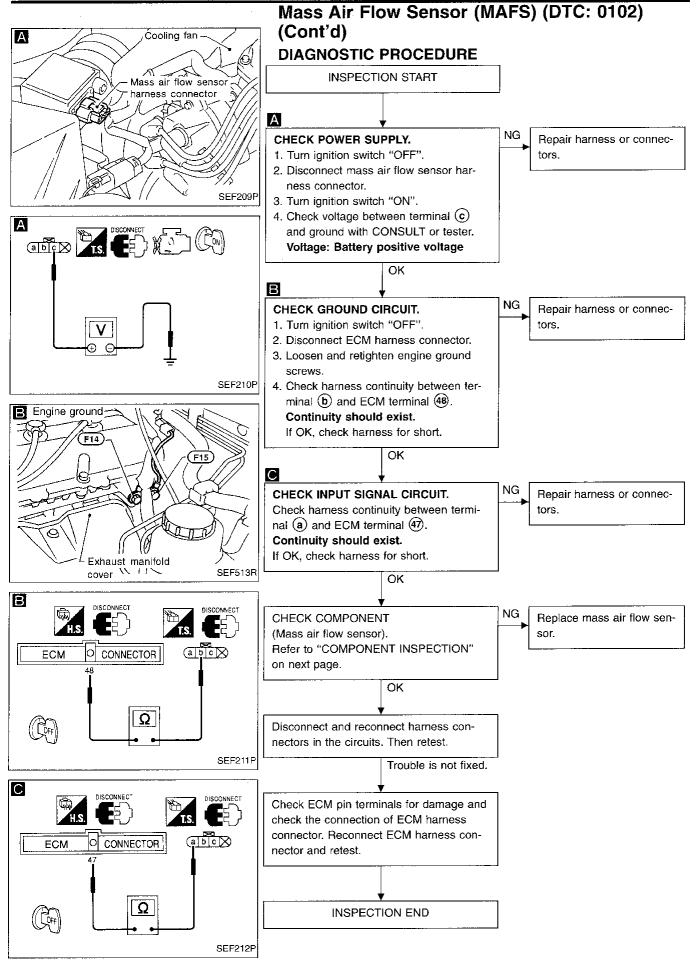

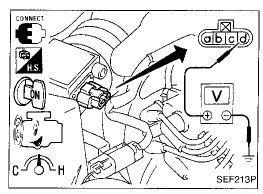

(**637**)

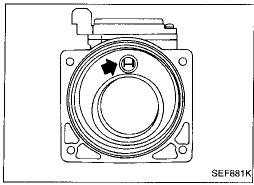

- Turn ignition switch "ON".
- Start engine and warm it up sufficiently.
- Check the voltage between ECM terminal 47 and
- Check for linear voltage rise in response to increases to about 4,000 rpm in engine speed.

Mass Air Flow Sensor (MAFS) (DTC: 0102) (Cont'd)

Mass Air Flow Sensor (MAFS) (DTC: 0102) (Cont'd)

COMPONENT INSPECTION

Mass air flow sensor

1. Turn ignition switch "ON".

2. Start engine and warm it up sufficiently.

Check voltage between terminal d and ground.

Conditions	Voltage V
Ignition switch "ON" (Engine stopped.)	Less than 1.0
Idle (Engine is warmed-up sufficiently.)	1.3 - 1.7
Idle to about 4,000 rpm*	1.3 - 1.7 to Approx. 4.0

*: Check for linear voltage rise in response to increases to about 4,000 rpm in engine speed.

4. If NG, remove mass air flow sensor from air duct. Check hot wire for damage or dust.

GI

MA

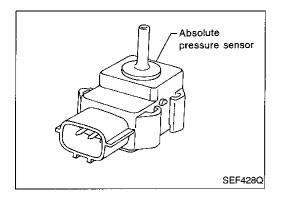

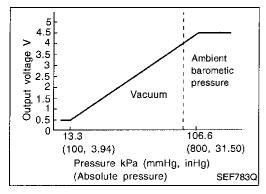

[DX

Absolute Pressure Sensor (DTC: 0803)

The absolute pressure sensor is connected to the MAP/BARO switch solenoid valve by a hose. The sensor detects ambient barometric pressure and intake manifold pressure and sends the voltage signal to the ECM. As the pressure increases, the voltage rises. The absolute pressure sensor is not used to control the engine system. It is used only for on board diagnosis.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0105 0803	A) An excessively low or high voltage from the sensor is sent to ECM.	Harness or connectors (Absolute pressure sensor circuit is open or shorted.) Absolute pressure sensor
	B) A low voltage from the sensor is sent to ECM under heavy load driving conditions.	Absolute pressure sensor
	C) A high voltage from the sensor is sent to ECM under light load driving conditions.	Hoses (Hoses between the intake manifold and absolute pressure sensor are disconnected or clogged.) Intake air leaks Absolute pressure sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Perform "Procedure for malfunction A" first. If the DTC cannot be confirmed, perform "Procedure for malfunction B", "OVER-ALL FUNCTION CHECK". If there is no problem on "Procedure for malfunction B", perform "Procedure for malfunction C".

Procedure for malfunction A

- 1) Turn ignition switch "ON".
- 2) Select "DATA MONITOR" mode with CONSULT.
- 3) Wait at least 6 seconds.

- OR -

- 1) Turn ignition switch "ON" and wait at least 6 seconds.
- 2) Select "MODE 3" with GST.

– OR -

- (NO TOOLS)
- 1) Turn ignition switch "ON" and wait at least 6 seconds.
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Absolute Pressure Sensor (DTC: 0803) (Cont'd)

If the DTC cannot be confirmed, perform "Procedure for malfunction B", "OVERALL FUNCTION CHECK" on next page.

Procedure for malfunction C

- 1) Start engine and warm it up sufficiently.
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
-) Start engine and let it idle.
- 5) Wait at least 15 seconds.

OR

- 1) Start engine and warm it up sufficiently.
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- 3) Start engine.
- 4) Let engine idle and wait at least 15 seconds.
- 5) Select "MODE 3" with GST.

Absolute Pressure Sensor (DTC: 0803) (Cont'd) COMPONENT INSPECTION

Absolute pressure sensor

- 1. Remove absolute pressure sensor with its harness connector connected.
- 2. Remove hose from absolute pressure sensor.
- 3. Turn ignition switch "ON" and check output voltage between terminal ② and engine ground.

The voltage should be 3.2 to 4.8 V.

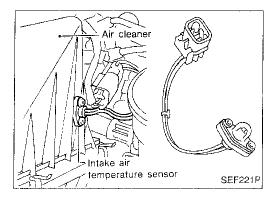

Use pump to apply vacuum of -26.7 kPa (-200 mmHg, -7.87 inHg, -3.87 psi) to absolute pressure sensor as shown in figure and check the output voltage.

The voltage should be 1.0 to 1.4 V lower than the value measured in step 3.

CAUTION:

Always calibrate the vacuum pump gauge when using it.

5. If NG, replace absolute pressure sensor.

Intake Air Temperature Sensor (DTC: 0401)

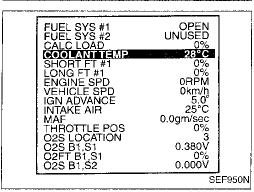

The intake air temperature sensor is built into the air cleaner. The sensor detects intake air temperature and transmits a signal to the ECM

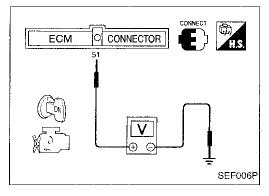

The temperature sensing unit employs a thermistor which is sensitive to the change in temperature. Electrical resistance of the thermistor decrease in response to the temperature rise.

This sensor is not used to control the engine system. It is used only for the on board diagnosis.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Item (Possible Cause)
P0110 0401	A) An excessively low or high voltage from the sensor is sent to ECM.	Harness or connectors (The sensor circuit is open or shorted.) Intake air temperature sensor.

Engine Coolant Temperature Sensor (ECTS) (DTC: 0103)

The engine coolant temperature sensor is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

(Reference data)

Throttle Position Sensor (DTC: 0403)

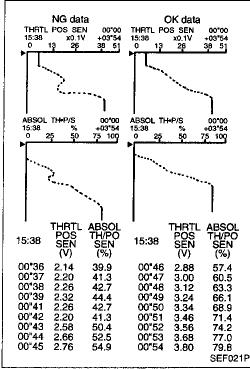

The throttle position sensor responds to the accelerator pedal movement. This sensor is a kind of potentiometer which transforms the throttle position into output voltage, and emits the voltage signal to the ECM. In addition, the sensor detects the opening and closing speed of the throttle valve and feeds the voltage signal to the ECM.

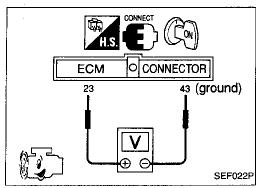

Idle position of the throttle valve is determined by the ECM receiving the signal from the throttle position sensor. This controls engine operation such as fuel cut. The throttle position sensor unit contains a built-in "Wide open and closed throttle position switch".

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0120 0403	 An excessively low or high voltage from the sensor is sent to ECM. Voltage sent to ECM is not practical when compared with mass air flow sensor and camshaft position sensor signals. 	Harness or connectors (The sensor circuit is open or shorted.) Throttle position sensor

Throttle Position Sensor (DTC: 0403) (Cont'd) **OVERALL FUNCTION CHECK**

Use this procedure to check the overall function of the throttle position sensor. During this check, a DTC might not be confirmed.

Turn ignition switch "OFF" and wait at least 5 seconds.

Turn ignition switch "ON". 3)

Select "MANU TRIG" and "HI SPEED" in "DATA MONI-TOR" mode with CONSULT.

Select "THRTL POS SEN" and "ABSOL TH-P/S" in "DATA MONITOR" mode with CONSULT.

Press RECORD on CONSULT SCREEN at the same time accelerator pedal is depressed.

Print out the recorded data and check the following:

 The voltage when accelerator pedal fully released is LC 0.3 - 0.7V.

• The voltage rise is linear in response to accelerator pedal depression.

The voltage when accelerator pedal fully depressed is approximately 4V.

Start engine and warm it up sufficiently. 1)

2) Turn ignition switch "OFF" and wait at least 5 seconds.

·OR

3) Turn ignition switch "ON".

Check the voltage between ECM terminal 23 and 43 (ground) and check the following:

The voltage when accelerator pedal fully released is 0.3 - 0.7V.

The voltage rise is linear in response to accelerator pedal depression.

The voltage when accelerator pedal fully depressed is approximately 4V.

Front Heated Oxygen Sensor (Front HO2S) (DTC: 0303)

The front HO2S is placed into the exhaust manifold. It detects the amount of oxygen in the exhaust gas compared to the outside air. The sensor has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The sensor signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal air-fuel ratio. The ideal air-fuel ratio occurs near the radical change from 1V to 0V.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0130	An excessively high voltage from the sensor is sent to ECM.	Harness or connectors
0303	The voltage from the sensor is constantly approx. 0.3V.	(The sensor circuit is open or shorted.)

Front Heated Oxygen Sensor Heater (DTC: 0901)

SYSTEM DESCRIPTION

The ECM performs ON/OFF control of the front heated oxygen sensor heater corresponding to the engine conditions.

Engine speed (rpm)	Engine condition	Front heated oxygen sensor heater
Above 4,400	_	OFF
Below 4,400	Heavy load	OFF
	Except above	ON

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0135 0901	The current amperage in the front heated oxygen sensor heater circuit is out of the normal range. (An improper voltage drop signal is sent to ECM through the front heated oxygen sensor heater.)	Harness or connectors (The front heated oxygen sensor heater circuit is open or shorted.) Front heated oxygen sensor heater

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

- Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- Start engine and run it for at least 5 seconds at idle speed.

 OR

- 1) Start engine and run it for at least 5 seconds at idle speed.
- 2) Select "MODE 3" with GST.

 OR —

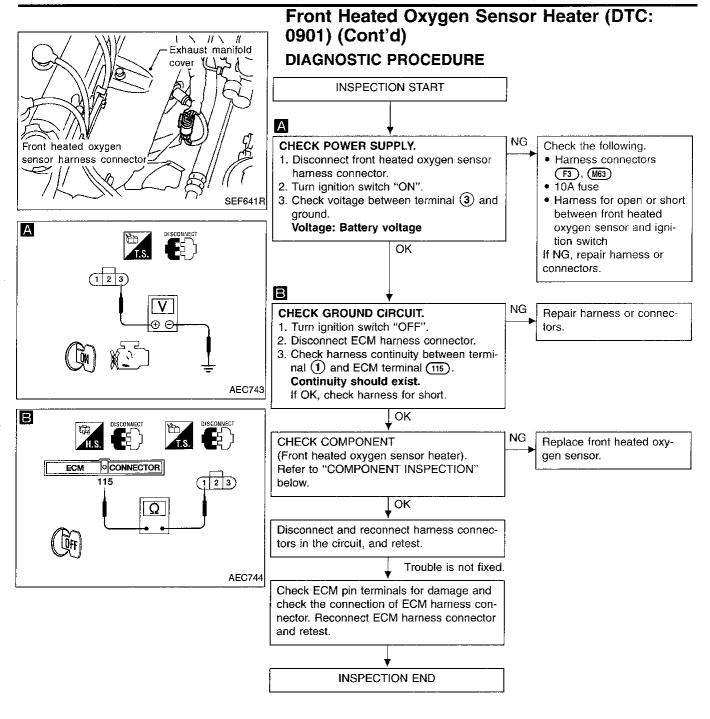

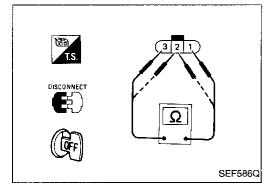

- 1) Start engine and run it for at least 5 seconds at idle speed.
- 2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
- 3) Perform "Diagnostic Test Mode II" (Self-diagnostic results) with ECM.

Front Heated Oxygen Sensor Heater (DTC: 0901) (Cont'd)

EC-FRO2/H-01

COMPONENT INSPECTION

Front heated oxygen sensor heater

Check resistance between terminals 3 and 1.

Resistance: 3.3 - 6.3Ω at 25°C (77°F)

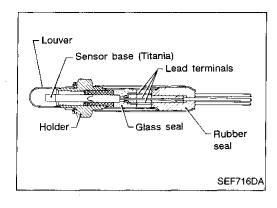

Check continuity between terminals (2) and (1), (3) and (2).

Continuity should not exist.

If NG, replace the front heated oxygen sensor.

CAUTION:

 Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.

Rear Heated Oxygen Sensor (Rear HO2S) (DTC: 0707)

The rear heated oxygen sensor (Rear HO2S), downstream three way catalyst, monitors the oxygen level in the exhaust gas.

This sensor is made of ceramic titania, the electric resistance of which drastically changes at the ideal air-fuel ratio.

The output voltage of the sensor, depending on its resistance, is approximately 0 to 2.2V.

The ECM supplies the sensor with approximately 2V and then measures the output voltage depending on its resistance.

The rear heated oxygen sensor is not directly used to control the engine system.

It is used only for the on board diagnosis of three way catalyst.

ON BOARD DIAGNOSIS LOGIC

The rear heated oxygen sensor has a much longer switching time between rich and lean, due to the oxygen storage capacity of the up-stream three way catalyst. To judge the malfunctions of rear heated oxygen sensor, ECM monitors the sensor's voltage value and the switching response during the various driving condition such as fuel-cut.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0136 0707	An excessively high voltage from the sensor is sent to ECM.	Harness or connectors (The sensor circuit is open.) Rear heated oxygen sensor
	 The maximum and minimum voltages from the sensor are not reached to the specified voltages. It takes more time for the sensor to respond between rich and lean than the specified time. Rear Heated Oxygen Sensor (Rear HO2S) (DTC: 0707) (Cont'd)

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the rear heated oxygen sensor circuit. During this check, a DTC might not be confirmed.

- 1) Start engine and warm it up sufficiently.
- Select "FUEL INJECTION" in "ACTIVE TEST" mode, and select "RR O2 SENSOR" as the monitor item with CONSULT.
- 3) Check "RR O2 SENSOR" at idle speed when adjusting "FUEL INJECTION" to ±25%.

"RR O2 SENSOR" should be above 0.60V at least once when the "FUEL INJECTION" is $\pm 25\%$.

"RR O2 SENSOR" should be below 0.55V at least once when the "FUEL INJECTION" is -25%.

- Start engine and warm it up sufficiently.
- Set voltmeter probes between ECM terminals
 (sensor signal) and
 (engine ground).

OR

3) Check the voltage when racing up to 4,000 rpm under no load at least 10 times.

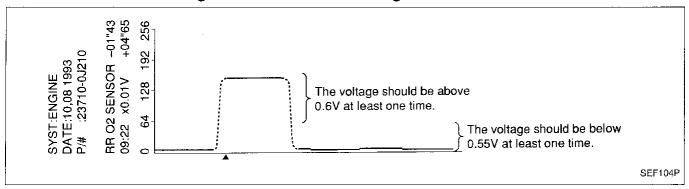

(depress and release accelerator pedal as soon as possible)

The voltage should be above 0.6V at least once. If the voltage is above 0.6V at step 3, step 4 is not necessary.

4) Check the voltage when racing up to 6,000 rpm under no load. Or keep vehicle at idling for 10 minutes, then check the voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in 3rd gear position.

The voltage should be below 0.55V at least once.

Note: After starting the engine, the output voltage of the rear heated oxygen sensor indicates higher voltage (approx. 5V at highest) than the normal operating range for about 7 seconds. This is due to checking for open circuits in rear heated oxygen sensor by on board diagnosis. Therefore, if you measure the voltage (at ECM terminal 52) during this diagnosis, the higher voltage will appear. (CONSULT will also show the higher voltage, GST may show approx. 0V.) This is not a malfunction even though it is out of the normal range.

No. 4 - 1 Cylinder Misfire, Multiple Cylinder Misfire (DTC: 0701 - 0605)

ON BOARD DIAGNOSIS LOGIC

If a misfire occurs, the engine speed will fluctuate. If the fluctuation is detected by the crankshaft position sensor (OBD), the misfire is diagnosed.

The misfire detection logic consists of the following two conditions.

Crankshaft position sensor (OBD)	Engine speed	ECM
	-	

1. One Trip Detection Logic (Three Way Catalyst Damage)

When a misfire is detected which will overheat and damage the three way catalyst, the malfunction indicator lamp (MIL) will start blinking; even during the first trip. In this condition, ECM monitors the misfire every 200 revolutions.

If the misfire frequency decreases to a level that will not damage the three way catalyst, the MIL will change from blinking to lighting up.

(After the first trip detection, the MIL will light up from engine starting. If a misfire is detected that will cause three way catalyst damage, the MIL will start blinking.)

2. Two Trip Detection Logic (Exhaust quality deterioration)

When a misfire that will not damage the three way catalyst (but will affect exhaust emission) occurs, the malfunction indicator lamp will light up based on the second consecutive trip detection logic. In this condition, ECM monitors the misfire for every 1,000 revolutions of the engine.

Diagnostic Trouble Code Nos.	Malfunction is detected when	Check Items (Possible Cause)
P0300 (0701)	Multiple cylinders misfire.	Improper spark plug Insufficient compression

TROUBLE DIAGNOSIS FOR DTC P0300 - P0304

TROUBLE DIAGNOSIS FOR DTC P0300 - P0304

No. 4 - 1 Cylinder Misfire, Multiple Cylinder Misfire (DTC: 0701 - 0605) (Cont'd)

COMPONENT INSPECTION

Ignition wires

- Inspect wires for cracks, damage, burned terminals and for improper fit.
- Measure the resistance of wires to their distributor cap terminal. Move each wire while testing to check for intermittent breaks.

Resistance:

13.6 - 18.4 k Ω /m (4.15 - 5.61 k Ω /ft) at 25°C (77°F) If the resistance exceeds the above specification, inspect ignition wire to distributor cap connection. Clean connection or replace the ignition wire with a new one.

Knock Sensor (KS) (DTC: 0304)

The knock sensor is attached to the cylinder block. It senses engine knocking using a piezoelectric element. A knocking vibration from the cylinder block is sensed as vibrational pressure. This pressure is converted into a voltage signal and sent to the ECM.

* Freeze frame data will not be stored in the ECM for the knock sensor. The MIL will not light for knock sensor malfunction.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0325 0304	An excessively low or high voltage from the knock sensor is sent to ECM.	Harness or connectors (The knock sensor circuit is open or shorted.) Knock sensor

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

Note: Before performing the following procedure, confirm that battery voltage is more than 10V.

- 1) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- 2) Start engine and run it for at least 5 seconds at idle speed. — OR —

- 1) Start engine and run it for at least 5 seconds at idle speed.
- 2) Select "MODE 3" with GST. — OR -

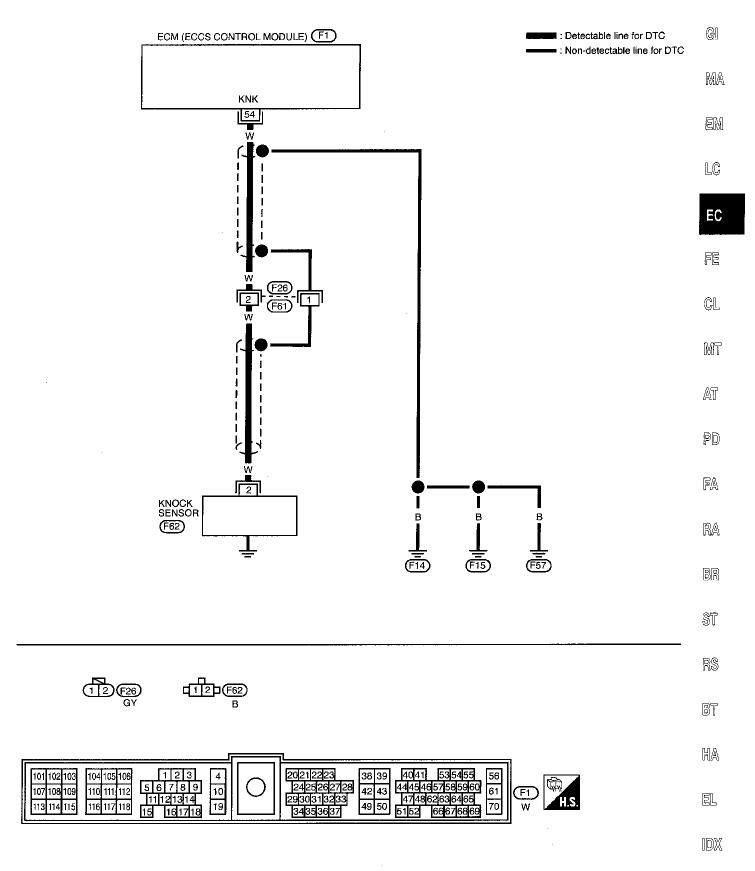

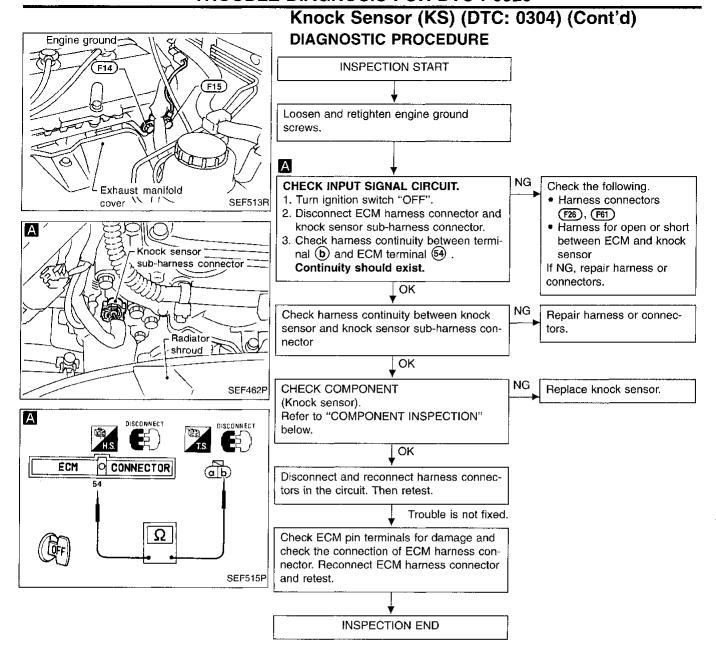

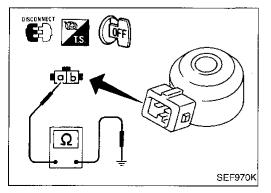

- 1) Start engine and run it for at least 5 seconds at idle
- 2) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
- 3) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

Knock Sensor (KS) (DTC: 0304) (Cont'd)

EC-KS-01

COMPONENT INSPECTION

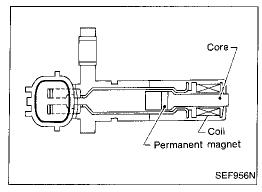

Knock sensor

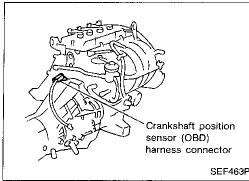

- 1. Disconnect knock sensor harness connector.
- 2. Check continuity between terminal ⓐ and ground.

 Resistance: 500 620 kΩ [at 25°C (77°F)]
- It is necessary to use an ohmmeter which can measure more than 10 $M\Omega.$

CAUTION:

Do not use any knock sensors that have been dropped or physically damaged. Use only new ones.

Crankshaft Position Sensor (CKPS) (OBD) (DTC: 0802)

The crankshaft position sensor (OBD) is located on the transmission housing facing the gear teeth (cogs) of the flywheel or drive plate. It detects the fluctuation of the engine revolution.

The sensor consists of a permanent magnet, core and coil.

When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

The ECM receives the voltage signal and detects the fluctuation of the engine revolution.

This sensor is not used to control the engine system. It is used only for the on board diagnosis of misfire.

COMPONENT INSPECTION

Crankshaft position sensor (OBD)

- Disconnect crankshaft position sensor (OBD) harness connector.
- 2. Loosen the fixing bolt of the sensor.
- 3. Remove the sensor.
- 4. Visually check the sensor for chipping.
- Check resistance as shown in the figure.
 Resistance: Approximately 166.5 203.5Ω at 20°C (68°F)

Camshaft Position Sensor (CMPS)(DTC: 0101)

The camshaft position sensor is a basic component of the ECCS. It monitors engine speed and piston position. These input signals to the ECM are used to control fuel injection, ignition timing and other functions.

The camshaft position sensor has a rotor plate and a wave-forming circuit. The rotor plate has 360 slits for a 1° signal and 4 slits for a 180° signal. The wave-forming circuit consists of Light Emitting Diodes (LED) and photo diodes.

The rotor plate is positioned between the LED and the photo diode. The LED transmits light to the photo diode. As the rotor plate turns, the slits cut the light to generate rough-shaped pulses. These pulses are converted into on-off signals by the wave-forming circuit and sent to the ECM.

Camshaft Position Sensor (CMPS)(DTC: 0101) (Cont'd)

DIAGNOSTIC PROCEDURE (NON-DETECTABLE CIRCUIT)

COMPONENT INSPECTION

Camshaft position sensor

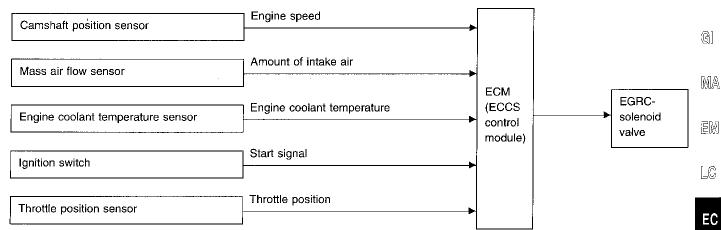

- 1. Start engine
- Check voltage between terminals 3, 4 and ground with AC range.

Condition	Terminals	Voltage
Engine running at idle	3 and ground4 and ground	Approximately 2.7V* (AC)

- *: Average voltage for pulse signal (Actual pulse signal can be confirmed by oscilloscope.)
- If NG, replace distributor assembly with camshaft position sensor.
- 3. Visually check signal plate for damage or dust.

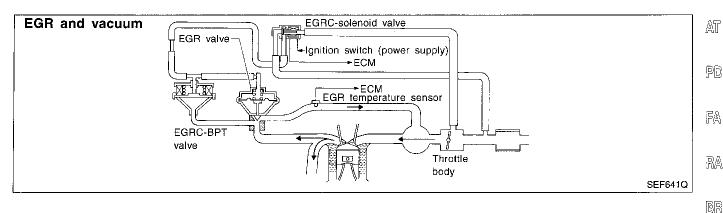

EGR Function (DTC: 0302)

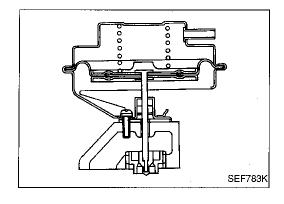

SYSTEM DESCRIPTION

This system cuts and controls vacuum applied to the EGR valve to suit engine operating conditions. This cut-and-control operation is accomplished through the ECM and the EGRC-solenoid valve. When the ECM detects any of the following conditions, current flows through the solenoid valve. This causes the port vacuum to be discharged into the atmosphere and the EGR valve remains closed.

- · Low engine coolant temperature
- Engine starting
- Engine stopped
- Engine idling
- Excessively high engine coolant temperature
- Mass air flow sensor malfunction

COMPONENT DESCRIPTION

Exhaust gas recirculation (EGR) valve

The EGR valve controls the amount of exhaust gas routed to the intake manifold. Vacuum is applied to the EGR valve in response to throttle valve opening. The vacuum controls the movement of a taper valve connected to the vacuum diaphragm in the EGR valve.

[D)X(

ST

RS

37

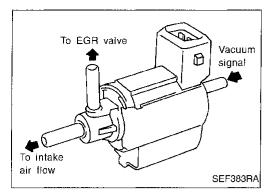

HA

FE

CI.

MT

321

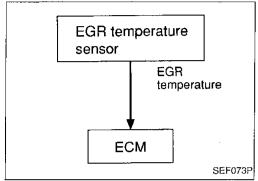

EGR Function (DTC: 0302) (Cont'd)

EGRC-solenoid valve

The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. A plunger will then move to cut the vacuum signal (from the throttle body to the EGR valve).

When the ECM sends an OFF signal, the vacuum signal passes through the solenoid valve. The signal then reaches the EGR valve.

ON BOARD DIAGNOSIS LOGIC

If the absence of EGR flow is detected by EGR temperature sensor under the condition that calls for EGR, a low-flow malfunction is diagnosed.

If EGR temperature sensor detects EGR flow under the condition that does not call for EGR, a high-flow malfunction is diagnosed.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0400 0302	A) The exhaust gas recirculation (EGR) flow is excessively low during the specified driving condition.	 EGR valve stuck closed EGRC-BPT valve leaking Passage blocked EGRC-solenoid valve Tube leaking for EGR valve EGR temperature sensor
	B) The exhaust gas recirculation (EGR) flow is excessively high during the specified driving condition.	EGRC-solenoid valve EGR valve leaking or stuck open EGR temperature sensor

OVERALL FUNCTION CHECK

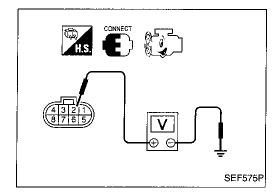

Use this procedure to check the overall EGR function. During this check, a DTC might not be confirmed.

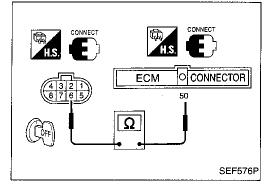

Before starting with the following procedure, check the engine coolant temperature of the freeze frame data with CONSULT or Generic Scan Tool.

If the engine coolant temperature is higher than or equal to 60°C (140°F), perform only "Procedure for malfunction A".

If the engine coolant temperature is lower than 60°C (140°F), perform both "Procedure for malfunction A" and "Procedure for malfunction B". In this case, check DTCs in the ECM and perform inspections one by one based on "INSPECTION PRIORITY", EC-82.

EFI sub-harness connector SEF517R

x 1000 r/min

Overall function check

EGR Function (DTC: 0302) (Cont'd)

Procedure for malfunction A

- 1) Start engine and warm it up sufficiently.
- 2) Check for the EGR valve lifting when revving from 2,000 rpm up to 4,000 rpm under no load.

EGR valve should lift up and down without sticking.

- 3) Disconnect EFI (EGR temperature sensor) sub-harness connector.
- 4) Check voltage between EGR temperature sensor sub-harness connector terminal ② and ground at idle speed.

 Less than 4.5V should exist.
- 5) Turn ignition switch "OFF".
 Check harness continuity between EGR temperature sensor sub-harness connector terminal (a) and ECM terminal (b).
 Continuity should exist.
- 6) Perform "COMPONENT INSPECTION", "EGR temperature sensor", EC-184.

327

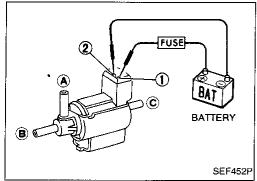

EGR Function (DTC: 0302) (Cont'd) COMPONENT INSPECTION

EGR valve

Apply vacuum to EGR valve vacuum port with a hand vacuum pump.

EGR valve spring should lift.

If NG, replace EGR valve.

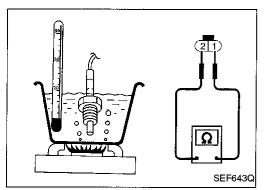

EGRC-solenoid valve

Check solenoid valve, following the table as shown below:

Conditions	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals ① and ②	Yes	No
No supply	No	Yes

If NG, replace the solenoid valve.

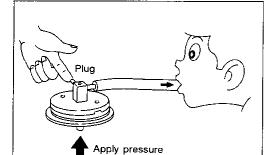

EGR temperature sensor

Check resistance change and resistance value.

EGR temperature °C (°F)	Voltage (V)	Resistance (MΩ)
0 (32)	4.81	7.9 - 9.7
50 (122)	2.82	0.57 - 0.70
100 (212)	0.8	0.08 - 0.10

If NG, replace EGR temperature sensor.

SEF083P

EGRC-BPT valve

- 1. Plug one of two ports of EGRC-BPT valve.
- Vacuum from the other port and check for leakage while applying a pressure above 0.981 kPa (100 mmH₂O, 3.94 inH₂O) from under EGRC-BPT valve.
- 3. If a leakage is noted, replace the valve.

EGRC-BPT Valve Function (DTC: 0306)

G

MA

LG

EC

GL

MT

ΑT

FA

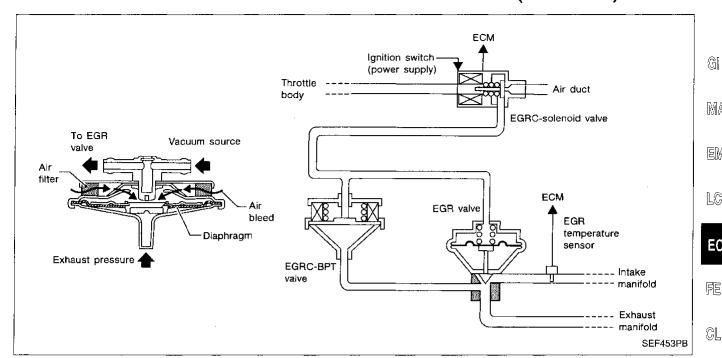

RA

BR

Bī

HA

IDX

SYSTEM DESCRIPTION

The EGRC-BPT valve monitors exhaust pressure to activate the diaphragm, controlling throttle body vacuum applied to the EGR valve. In other words, recirculated exhaust gas is controlled in response to positioning of the EGR valve or to engine operation.

ON BOARD DIAGNOSIS LOGIC

If too much EGR flow exists due to an EGRC-BPT valve malfunction, off idle engine roughness will increase. If the roughness is large, then the vacuum to the EGR valve is interrupted through the EGRC-solenoid valve. If the engine roughness is reduced at that time, the EGRC-BPT valve malfunction is indicated.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P0402	The EGRC-BPT valve does not operate properly.	EGRC-BPT valve
0306		Misconnected rubber tube
		Blocked rubber tube

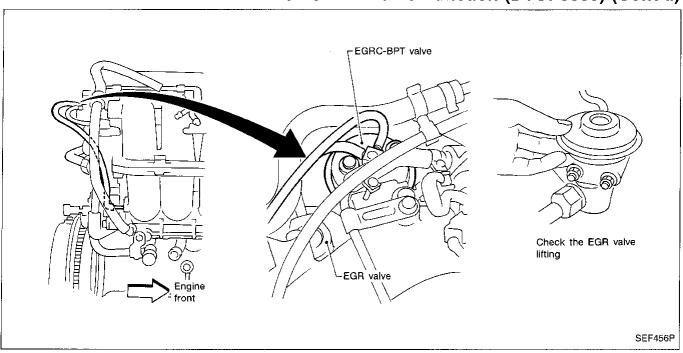

OVERALL FUNCTION CHECK

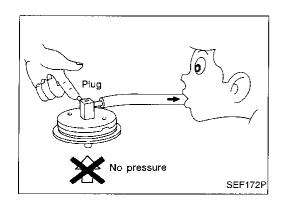

Use this procedure to check the overall function of the EGRC-BPT valve. During this check, a DTC might not be confirmed.

- 1. Disconnect the rubber tube to the fuel pressure regulator at the intake manifold.
- Disconnect the rubber tube to the EGRC-solenoid valve at the EGRC-BPT valve. Connect the intake manifold and the EGRC-BPT valve with a rubber tube that has 1 mm (0.04 in) dia. orifice installed. (The intake manifold vacuum will be directly applied to the EGRC-BPT valve.)
- 3. Start engine.
- Check for the EGR valve lifting with engine at less than 1,500 rpm under no load.
 - EGR valve should remain closed.
- 5. Check the EGR valve lifting when revving from 2,000 rpm up to 4,000 rpm under no load. EGR valve should lift up, and go down without sticking when the engine is returned to idle.
- 6. Check rubber tube between EGRC-solenoid valve and throttle body for misconnection, cracks or blockages.

329 EC-185

EGRC-BPT Valve Function (DTC: 0306) (Cont'd)

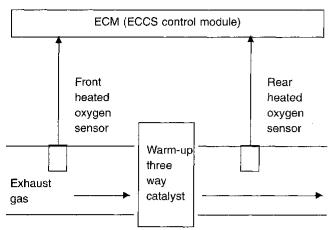

COMPONENT INSPECTION

EGRC-BPT valve

- 1) Plug one of two ports of EGRC-BPT valve.
- Vacuum from the other port and check leakage without applying any pressure from under EGR-BPT valve. Leakage should exist.

Three Way Catalyst Function (DTC: 0702)

ON BOARD DIAGNOSIS LOGIC

The ECM monitors the switching frequency ratio of front heated oxygen sensor and rear heated oxygen sensor.

A warm-up three way catalyst with high oxygen storage capacity will indicate a low switching frequency of rear heated oxygen sensor. As oxygen storage capacity decreases, the rear heated oxygen sensor switching frequency will increase.

When the frequency ratio of front heated oxygen sensor and rear heated oxygen sensor approaches a specified limit value, the second stage diagnosis is applied.

The second stage diagnosis switches the mixture ratio feedback control using front heated oxygen sensor to rear heated oxygen sensor.

Then ECM measures the switching lag time between front heated oxygen sensor and rear heated oxygen sensor.

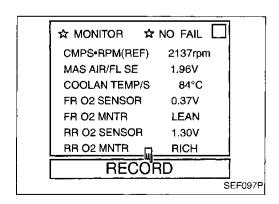

The longer lag time indicates the greater oxygen storage capacity. If the lag time is within the specified level, the warm-up three way catalyst malfunction is diagnosed.

The warm-up three way catalyst function has one trip detection logic.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)	 Mʻ
P0420 0702	Warm-up three way catalyst does not operate properly. Warm-up three way catalyst does not have enough oxygen	Warm-up three way catalyst Exhaust tube	at
	storage capacity.	Intake air leakInjectorsInjector leak	9

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the warm-up three way catalyst. During this check, a DTC might not be confirmed.

- 1) Start engine and warm it up sufficiently.
- Set "MANU TRIG" and "HI SPEED", then select "FR O2 SENSOR", "RR O2 SENSOR", "FR O2 MNTR", "RR O2 MNTR" in "DATA MONITOR" mode with CON-SULT.
- 3) Touch "RECORD" on CONSULT screen with engine speed held at 2,000 rpm constant under no load.
- 4) Make sure that the switching frequency between "RICH" and "LEAN" of "RR O2 SENSOR" is very less than that of "FR O2 SENSOR". Switching frequency ratio =

omioning modulatory ratio =

Rear heated oxygen sensor switching frequency

Front heated oxygen sensor switching frequency

This ratio should be less than 0.8.

331

EC

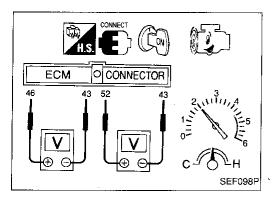

EA

RA

88

RS

BŢ

Three Way Catalyst Function (DTC: 0702) (Cont'd)

- 1) Start engine and warm it up sufficiently.
- 2) Set voltmeter probes between ECM terminals (front heated oxygen sensor signal) and (a) (engine ground), and ECM terminals (c) (rear heated oxygen sensor signal) and (a) (engine ground).
- 3) Keep engine speed at 2,000 rpm constant under no load.
- 4) Make sure that the voltage switching frequency (high & low) between ECM terminals (3) and (4) is very less than that of ECM terminals (46) and (3).

Switching frequency ratio =

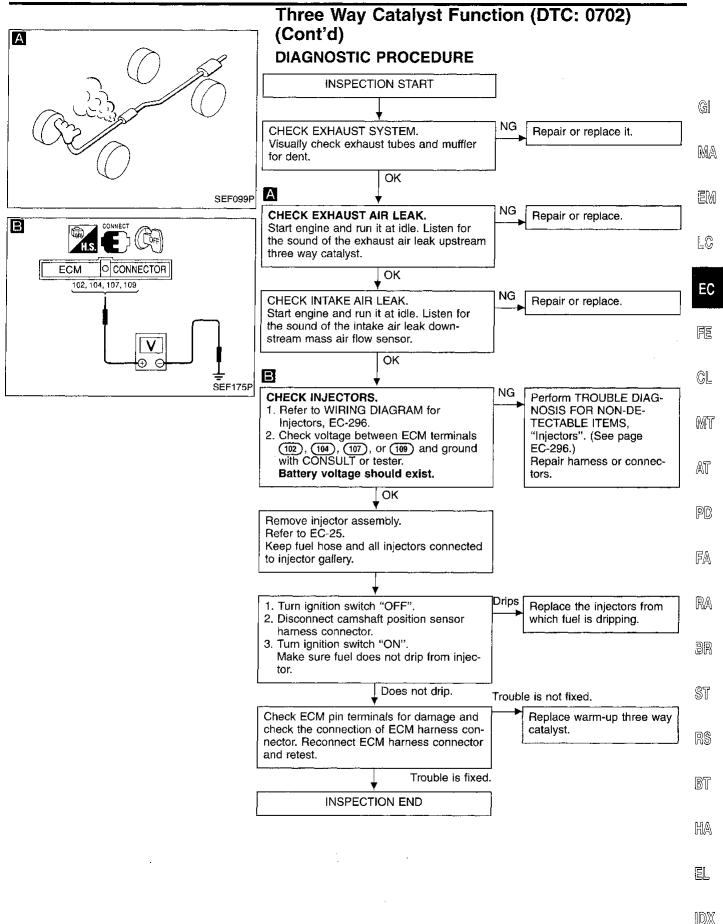

Rear heated oxygen sensor voltage switching frequency

Front heated oxygen sensor voltage switching frequency

This ratio should be less than 0.8.

If the ratio is greater than 0.8, it means warm-up three way catalyst does not operate properly.

Note: If the voltage at terminal (46) does not switch periodically more than 5 times within 10 seconds at step 3, perform TROUBLE DIAGNOSIS FOR DTC P0130 (Front heated oxygen sensor) first. (See page EC-136.)

EC-189 333

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705)

ON BOARD DIAGNOSIS LOGIC

This diagnosis uses two methods to detect leaks in the EVAP purge line.

The first method, the pressure test, makes use of vapor pressure in the fuel tank. The second method, the vacuum test, makes use of engine intake manifold vacuum.

Pressure test

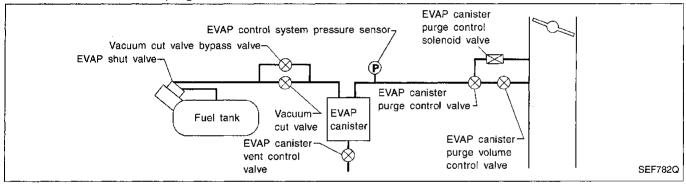

The EVAP canister vent control valve is closed to shut the EVAP purge line. The vacuum cut valve bypass valve will then be opened to clear the line between the fuel tank and the EVAP canister purge control valve. The EVAP control system pressure sensor can now monitor the pressure inside the fuel tank.

If pressure increases, the ECM will check for leaks in the line between the vacuum cut valve and EVAP canister purge control valve. If no pressure does not increase, the ECM will perform the "Vacuum test".

Vacuum test

If pressure does not increase in the "Pressure test", the ECM will check for leaks in the line between the fuel tank and EVAP canister purge control valve, under the following "Vacuum test" conditions.

The vacuum cut valve bypass valve is opened to clear the line between the fuel tank and the EVAP canister purge control valve. The EVAP canister vent control valve will then be closed to shut the EVAP purge line off. The EVAP canister purge volume control valve and EVAP canister purge control valve are opened to depressurize the EVAP purge line using intake manifold vacuum. After this occurs, the EVAP canister purge control valve and EVAP canister purge volume control valve will be closed.

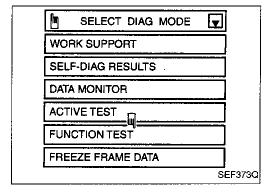

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705) (Cont'd)

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)	. Gi

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705) (Cont'd)

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EVAP control system (Small leak). During this check, a DTC might not be confirmed.

NOTE:

Prepare one-way valve (Part No. 14958 V6700) for this test.

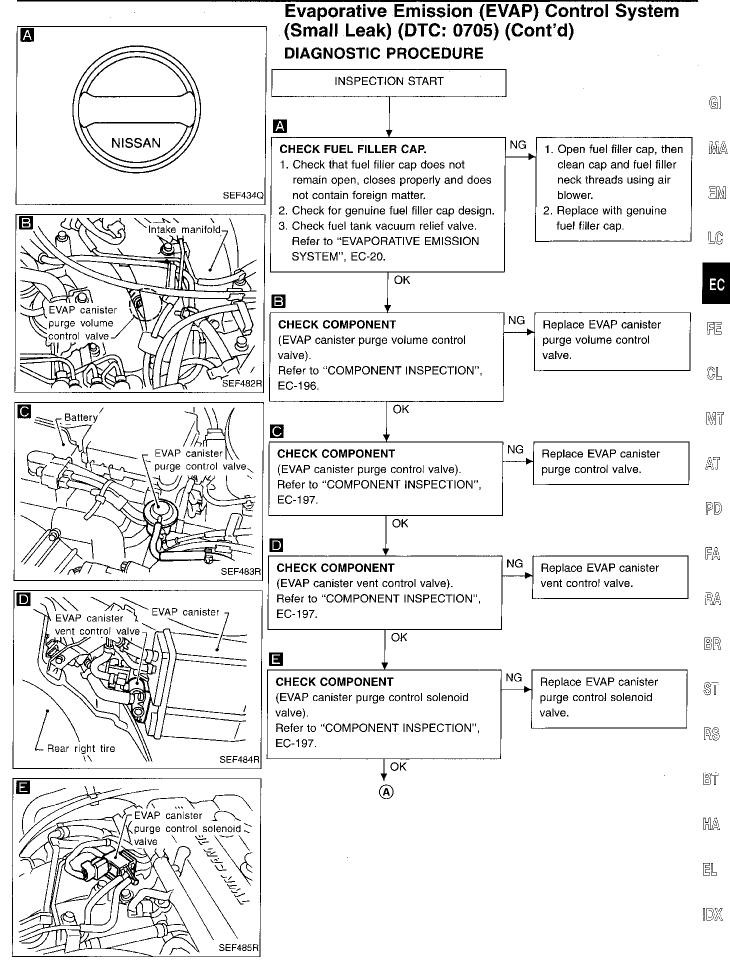

- 1) Turn ignition switch "OFF".
- 2) Completely fill fuel tank.
- 3) Set up one-way valve (Part No. 14958 V6700), pressure gauge and suitable pump as shown at left. Pressurize the system to 13.3 kPa (100 mmHg, 3.94 inHg, 1.93 psi). Measure the amount of depressurization in kPa (mmHg, inHg) after one minute with the system left unattended.
- Apply 12 volts DC to EVAP canister vent control valve. The valve will close. (Continue to apply 12V until the end of test.)
- Apply 12 volts DC to vacuum cut valve bypass valve. The valve will open. (Continue to apply 12V until the end of test.)
- 6) Disconnect rubber tube between vacuum cut valve and EVAP shut valve. Set up one-way valve (Part No. 14958 V6700), pressure gauge and suitable pump as shown at left.
- 7) Increase system pressure until gauge registers 13.3 kPa (100 mmHg, 3.94 inHg, 1.93 psi). [If pump is rated at a discharge volume of 0.13ℓ (1/8 US qt, 1/8 Imp qt) for one operating stroke, it is capable of increasing pressure to 13.3 kPa (100 mmHg, 3.94 inHg, 1.93 psi) with approximately 60 operating strokes. If pressure does not increase at all during the test, diagnosis will be ineffective ("NG")].

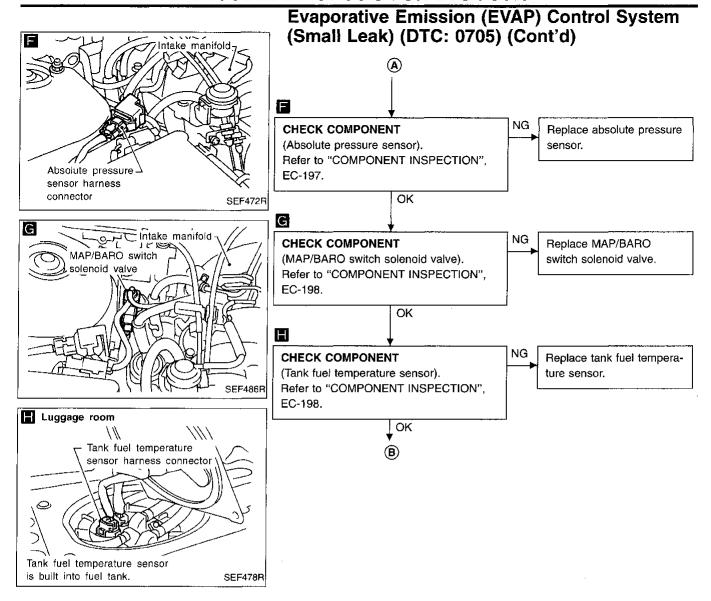

CAUTION:

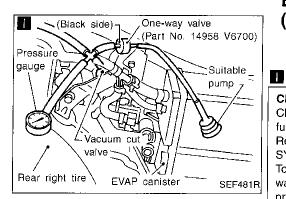

Do not allow pump pressure to exceed 13.3 kPa (100 mmHg, 3.94 inHg, 1.93 psi). A higher pressure may damage fuel tank and EVAP canister.

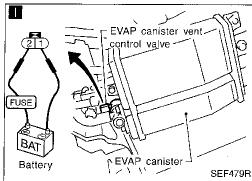

- 8) Make sure that after one minute the amount of pressure recovery is within the following.
 - The measured amount in step 3 + 4.51 kPa (33.87 mmHg, 1.333 inHg, 0.654 psi).
- 9) Check fuel filler cap and fuel tank. Refer to "DIAGNOS-TIC PROCEDURE", EC-193.

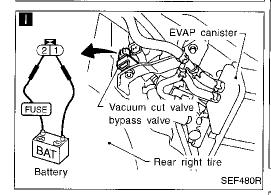

337

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705) (Cont'd)

NG

CHECK EVAP PURGE LINE.

Check EVAP purge line (pipe, rubber tube, fuel tank and EVAP canister) for cracks. Refer to "EVAPORATIVE EMISSION SYSTEM, EC-21.

To locate cracked areas, apply soapy water to locations in question. Apply pump pressure as shown in the figure at left. Air bubbles will appear from cracked areas. **CAUTION:**

Do not allow pump pressure to exceed 13.3 kPa (100 mmHg, 3.94 inHg, 1.93 psi). A higher pressure may damage fuel tank and EVAP canister.

- Do not use super color check liquid, etc.
- Do not depressurize inside EVAP purge line.
- 1. Turn ignition switch "OFF".
- Apply 12 volts DC to EVAP canister vent control valve. The valve will close. (Continue to apply 12V until the end of test.)
- Apply 12 volts DC to vacuum cut valve bypass valve. The valve will open. (Continue to apply 12V until the end of test.)
- Disconnect rubber tube between vacuum cut valve and EVAP shut valve. Set up one-way valve (Part No. 14958 V6700), pressure gauge and suitable pump as shown at left.

Ток

Clean EVAP purge line (pipe and rubber tube) using air blower.

Disconnect and reconnect harness connectors in the circuit. Then retest.

Trouble is not fixed.

Check ECM pin terminals for damage and check the connection of ECM harness connector. Reconnect ECM harness connector and retest.

INSPECTION END

Repair or replace it.

- Disconnect EVAP canister purge volume control valve harness connector.
- 2. Check resistance between the following terminals. terminal (2) and terminals (1), (3)
 - terminal (5) and terminals (4), (6)

Resistance:

Approximately 30Ω [At 25°C (77°F)]

- 3. Reconnect EVAP canister purge volume control valve harness connector.
- Remove EVAP canister purge volume control valve from intake manifold collector and disconnect hoses from the valve.
 - (Plug the purge hoses. The EVAP canister purge volume control valve harness connector should remain connected.)
- 5. Turn ignition switch "ON".
- Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that EVAP canister purge volume control valve shaft moves smoothly forward and backward according to the valve opening.
 If NG, replace the EVAP canister purge volume control

- Disconnect EVAP canister purge volume control valve harness connector.
- 2. Check resistance between the following terminals. terminal ② and terminals ①, ③ terminal ⑤ and terminals ④, ⑥

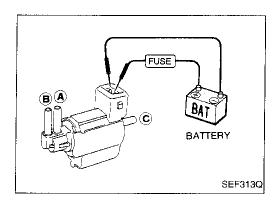

-- OR --

Resistance:

valve.

Approximately 30Ω [At 25°C (77°F)]

- Reconnect EVAP canister purge volume control valve harness connector.
- 4. Remove EVAP canister purge volume control valve from intake manifold collector and disconnect hoses from the valve.
 - (Plug the purge hoses. The EVAP canister purge volume control valve harness connector should remain connected.)
- 5. Turn ignition switch "ON" and "OFF". Check that EVAP canister purge volume control valve shaft moves smoothly forward and backward according to the ignition switch position.
 - If NG, replace the EVAP canister purge volume control valve.

Evaporative Emission (EVAP) Control System (Small Leak) (DTC: 0705) (Cont'd)

EVAP canister purge control solenoid valve

Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals	Yes	No
No supply	No	Yes

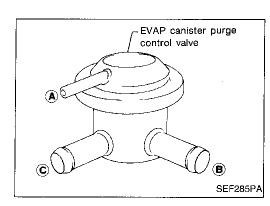

If NG, replace solenoid valve.

G[

MA

EM

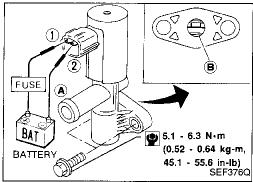

EVAP canister purge control valve

Check EVAP canister purge control valve as follows:

Blow air in port (A), (B) and (C), and check that there is no leakage.

Apply vacuum to port (A). [Approximately -13.3 to -20.0 kPa (-100 to -150 mmHg, -3.94 to -5.91 inHg)] Blow air in port © and check that it flows freely out of port (B).

EVAP canister vent control valve

Check air passage continuity.

Condition	Air passage continuity between (A) and (B)
12V direct current supply between terminals 1 and 2	No
No supply	Yes

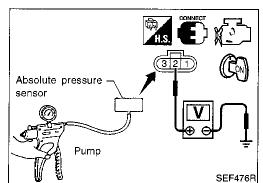

If NG, clean valve using air blower or replace as necessary.

- Remove absolute pressure sensor from bracket with its harness connector connected.
- Remove hose from absolute pressure sensor.
- Turn ignition switch "ON" and check output voltage between terminal (2) and engine ground. The voltage should be 3.2 to 4.8 V.

Use pump to apply vacuum of -26.7 kPa (-200 mmHg, -7.87 inHg, -3.87 psi) to absolute pressure sensor as shown in figure and check the output voltage.

The voltage should be 1.0 to 1.4 V lower than the value measured in step 3.

20 (68)	2.3 - 2.7
50 (122)	0.79 - 0.90

If NG, replace tank fuel temperature sensor.

Evaporative Emission (EVAP) Canister Purge Control Valve/Solenoid Valve (DTC: 0807)

SYSTEM DESCRIPTION

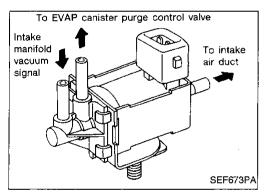

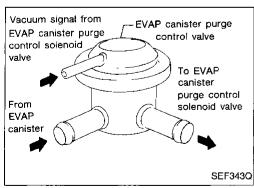

This system controls the vacuum signal applied to the EVAP canister purge control valve.

When the ECM detects any of the following conditions, current does not flow through the EVAP canister purge control solenoid valve.

The solenoid valve cuts the vacuum signal so that the EVAP canister purge control valve remains closed.

- Ignition switch "ON"
- Closed throttle position
- · Low or high engine coolant temperature
- During deceleration
- Engine stopped
- Low vehicle speed (M/T models)

COMPONENT DESCRIPTION

EVAP canister purge control solenoid valve

The EVAP canister purge control solenoid valve responds to signals from the ECM. When the ECM sends an OFF signal, the vacuum signal (from the intake manifold to the EVAP canister purge control valve) is cut.

When the ECM sends an ON (ground) signal, the vacuum signal passes through the EVAP canister purge control solenoid valve. The signal then opens the EVAP canister purge control valve.

EVAP canister purge control valve

When the vacuum signal is cut by EVAP canister purge control solenoid valve, EVAP canister purge control valve closes.

EVAP canister purge control valve

- Blow air in ports (A), (B) and (C) and check that there is no leakage.
- Apply vacuum to port (a). [Approximately -13.3 to -20.0 kPa (-100 to -150 mmHg, -3.94 to -5.91 inHg, -1.93 to -2.90 psi)]
 Then blow air in port (c) and check that air flows freely out of port (b).

Evaporative Emission (EVAP) Canister Vent Control Valve (DTC: 0903)

The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.

This solenoid (the EVAP canister vent control valve) responds to signals from the ECM.

When the ECM sends an ON signal, the coil in the solenoid valve is energized.

A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative loss system components.

This solenoid valve is used only for diagnosis, and usually remains opened.

When the vent is closed, under normal purge conditions, the evaporative loss system is depressurized and allows "EVAP Control System (Small Leak)" diagnosis.

Idle Air Control Valve (IACV) — Auxiliary Air Control (AAC) Valve (DTC: 0205)

SYSTEM DESCRIPTION

This system automatically controls engine idle speed to a specified level. Idle speed is controlled through fine adjustment of the amount of air which by-passes the throttle valve via IACV-AAC valve. The IACV-AAC valve repeats ON/OFF operation according to the signal sent from the ECM. The camshaft position sensor detects the actual engine speed and sends a signal to the ECM. The ECM then controls the ON/OFF time of the IACV-AAC valve so that engine speed coincides with the target value memorized in ECM. The target engine speed is the lowest speed at which the engine can operate steadily. The optimum value stored in the ECM is determined by taking into consideration various engine conditions, such as during warm up, deceleration, and engine load (air conditioner, power steering and cooling fan operation).

COMPONENT DESCRIPTION

IACV-ACC valve

The IACV-AAC valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of air that will flow through the valve. The more air that flows through the valve, the higher the idle speed.

Manifold Absolute Pressure (MAP)/Barometric Pressure (BARO) Switch Solenoid Valve (DTC: 1302)

SYSTEM DESCRIPTION

This system allows the absolute pressure sensor to monitor either ambient barometric pressure or intake manifold pressure. The MAP/BARO switch solenoid valve switches between two passages by ON-OFF pulse signals from the ECM. (One passage is from the intake air duct, the other is from the intake manifold.) Either ambient barometric pressure or intake manifold pressure is applied to the absolute pressure sensor.

Solenoid	Conditions	
	Immediately after starting engine	
	or	
	More than 5 minutes after the solenoid valve shuts OFF.	
ON	and	
ON	Throttle valve is shut or almost fully shut for	
	more than 1 second	
•	and	
	Vehicle speed is less than 100 km/h (62 MPH).	

COMPONENT DESCRIPTION

The MAP/BARO switch solenoid valve switches its air flow passage according to the voltage signal sent from the ECM. When voltage is supplied from the ECM, the MAP/BARO switch solenoid turns "ON". Then, the absolute pressure sensor can monitor the ambient barometric pressure. When voltage is not supplied from the ECM, the MAP/BARO switch solenoid valve turns "OFF". Then, the sensor monitors intake manifold pressure.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)	. MA

- 2) Turn ignition switch "OFF" and wait at least 5 seconds.3) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- 4) Start engine and let it idle.
- 5) Wait at least 8 seconds.

- 1) Start engine and warm it up sufficiently.
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- 3) Start engine and let it idle.
- 4) Wait at least 8 seconds.
- 5) Select "MODE 3" with GST.

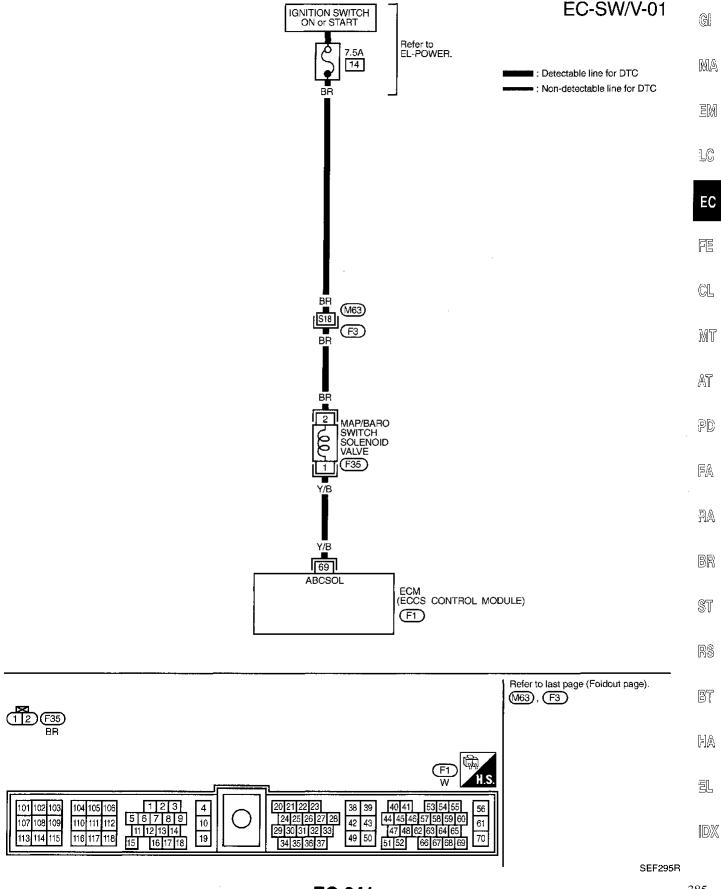

- OR

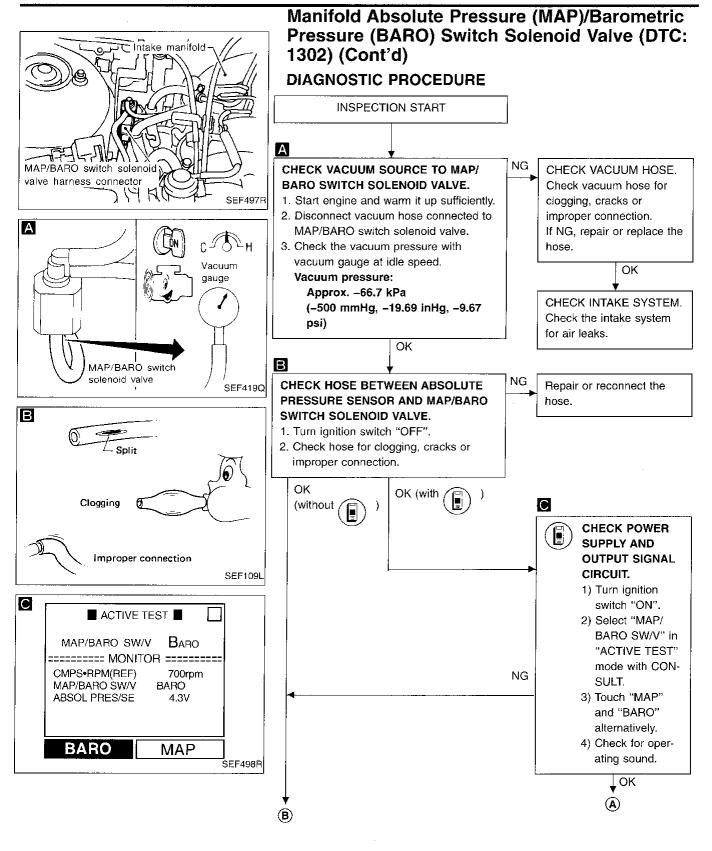

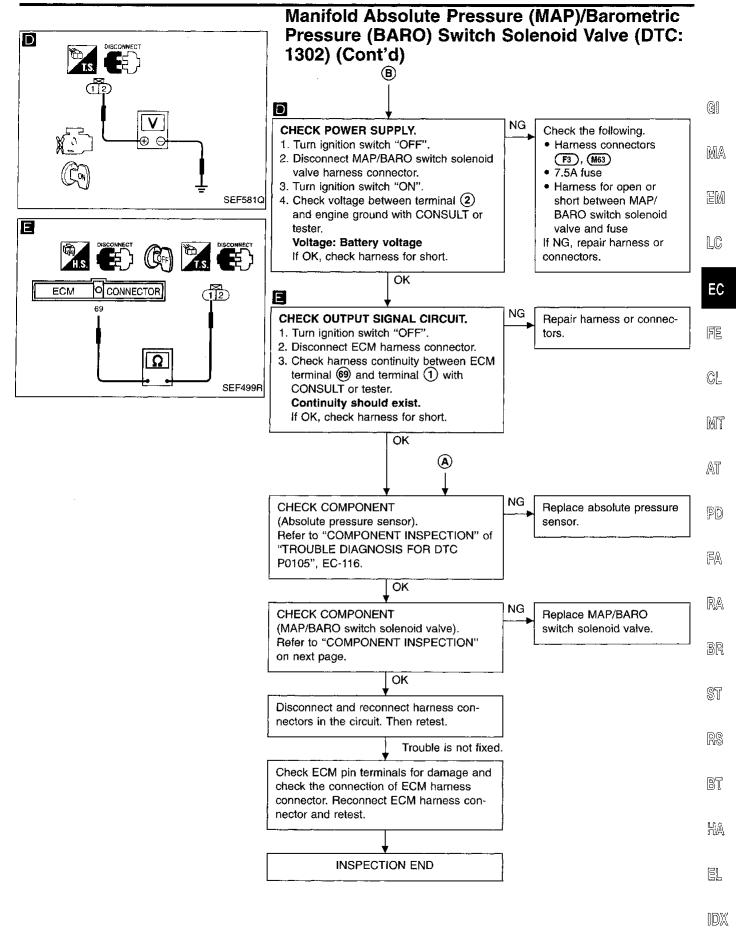

- 1) Start engine and warm it up sufficiently.
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- 3) Start engine and let it idle.
- 4) Wait at least 8 seconds.
- 5) Turn ignition switch "OFF", wait at least 5 seconds and
- then turn "ON".

 6) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

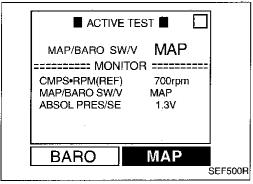

Manifold Absolute Pressure (MAP)/Barometric Pressure (BARO) Switch Solenoid Valve (DTC: 1302) (Cont'd)

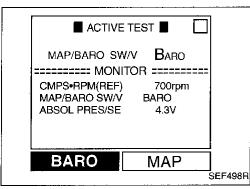

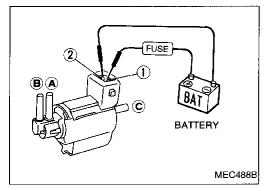

387

Manifold Absolute Pressure (MAP)/Barometric Pressure (BARO) Switch Solenoid Valve (DTC: 1302) (Cont'd)

COMPONENT INSPECTION

MAP/BARO switch solenoid valve

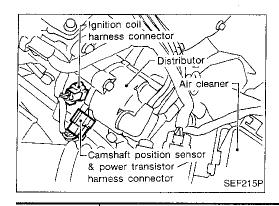

- 1. Start engine and warm it up sufficiently.
- Perform "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
- 3. Check the following.
 - When "MAP" is selected, "ABSOL PRES/SE" indicates approximately 1.3V.
 - When "BARO" is selected, "ABSOL PRES/SE" indicates approximately 4.3V.
- 4. If NG, replace solenoid valve.

- 1. Remove MAP/BARO switch solenoid valve.
- 2. Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals ① and ②	Yes	No
No supply	No	Yes

3. If NG, replace solenoid valve.

Ignition Signal (DTC: 0201)

Ignition coil & power transistor (Built into distributor)

The ignition signal from the ECM is sent to and amplified by the power transistor. The power transistor turns on and off the ignition coil primary circuit. This on-off operation induces the proper high voltage in the coil secondary circuit.

Crankshaft Position Sensor (CKPS) (OBD) (DTC: 0905)

The crankshaft position sensor (OBD) is located on the transmission housing facing the gear teeth (cogs) of the flywheel or drive plate. It detects the fluctuation of the engine revolution.

The sensor consists of a permanent magnet, core and coil.

When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

The ECM receives the voltage signal and detects the fluctuation of the engine revolution.

This sensor is not directly used to control the engine system.

It is used only for the on board diagnosis of misfire.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1336 0905	A chipping of the flywheel or drive plate gear tooth (cog) is detected by the ECM.	Harness or connectors Crankshaft position sensor (OBD) Flywheel (Drive plate)

DIAGNOSTIC TROUBLE CODE CONFIRMATION PROCEDURE

- 1) Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- 2) Start engine and run it for at least 4 minutes at idle speed.

EGRC-Solenoid Valve (DTC: 1005)

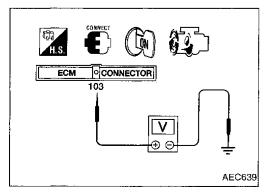

The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. A plunger will then move to cut the vacuum signal (from the throttle body to the EGR valve.)

When the ECM sends an OFF signal, the vacuum signal passes through the solenoid valve. The signal then reaches the EGR valve.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1400 1005	The improper voltage signal is sent to ECM through EGRC-solenoid valve.	Harness or connectors (The EGRC-solenoid valve circuit is open or shorted.) EGRC-solenoid valve

OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the EGRC-solenoid valve circuit. During this check, a DTC might not be confirmed.

OR

1) Turn ignition switch "ON".

2) Perform "EGRC SOL/V CIRCUIT" in "FUNCTION TEST" mode with CONSULT.

Turn ignition switch "ON".

 Perform "EGRC SOLENOID VALVE" in "ACTIVE TEST" mode with CONSULT and check the operating sound, according to ON/OFF switching.

Start engine and warm it up sufficiently.

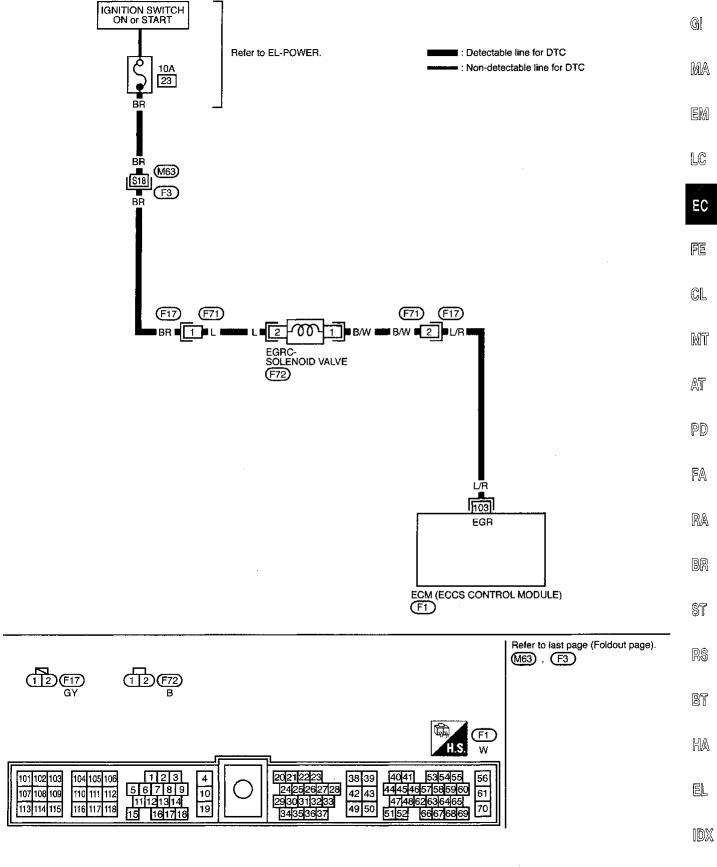

- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- 3) Start engine again.
- 4) Check the voltage between ECM terminal 103 and ground at idle speed.

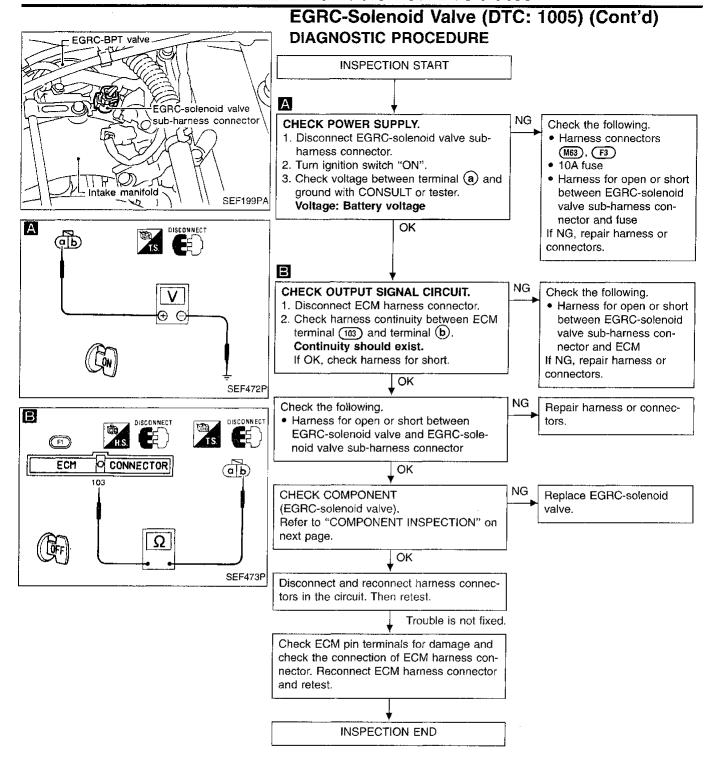

Voltage: 0.04 - 0.08V

 Check that the voltage changes to battery voltage and returns to 0.04 - 0.08V when the engine speed increases to about 2,500 rpm.

EGR Temperature Sensor (DTC: 0305)

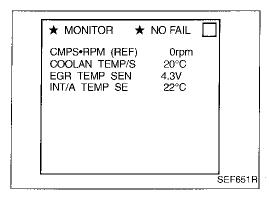

The EGR temperature sensor detects temperature changes in the EGR passage way. When the EGR valve opens, hot exhaust gases flow, and the temperature in the passage way changes. The EGR temperature sensor is a thermistor that modifies a voltage signal sent from the ECM. This modified signal then returns to the ECM as an input signal. As the temperature increases, EGR temperature sensor resistance decreases.

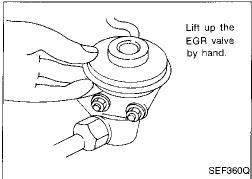

This sensor is not directly used to control the engine system. It is used only for the on board diagnosis.

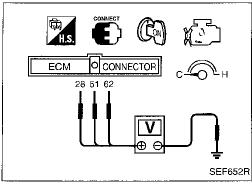

(Reference data)

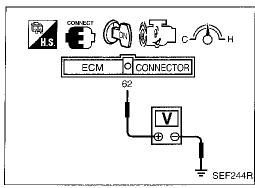

EGR temperature °C (°F)	Voltage (V)	Resistance (M Ω)

EGR Temperature Sensor (DTC: 0305) (Cont'd) **OVERALL FUNCTION CHECK**

Use this procedure to check the overall function of the EGR temperature sensor. During this check, a DTC might not be confirmed.

Procedure for malfunctions A and B

Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.

Confirm that engine coolant temperature and intake air temperature are lower than 40°C (104°F). (If necessary, wait until the temperatures equal atmospheric tempera-

3) Confirm that "EGR TEMP SEN" reading is between 3,45V and 5.0V.

Start engine and warm it up sufficiently.

5) Run engine at idle for at least 2 minutes.

Confirm that EGR valve is not lifting. If NG, go to TROUBLE DIAGNOSES FOR DTC P0400 and P0402. (See pages EC-177 and 185.)

7) Read "EGR TEMP SEN" at about 1,500 rpm with EGR valve lifted up to the full position by hand.

Voltage should decrease to less than 1.0V.

8) If step 7 is OK, perform TROUBLE DIAGNOSES FOR DTC P0400, P0402 and P1400, (See pages EC-177, 185 and 254.)

Turn ignition switch "ON"

1) Confirm that voltage between ECM terminals (5), (28) and ground are more than 2.72V. (If necessary, wait until engine coolant temperature and intake air temperature equal atmospheric temperature.)

Confirm that voltage between ECM terminal 62 and ground is between 3.45V and 5.0V.

Start engine and warm it up sufficiently. 4)

Run engine at idle for at least 2 minutes. 5)

Confirm that EGR valve is not lifting. If NG, go to TROUBLE DIAGNOSES FOR DTC P0400 and P0402. (See pages EC-177 and 185.)

7) Check voltage between ECM terminal (2) and ground at about 1,500 rpm with EGR valve lifted up to the full position by hand.

Voltage should decrease to less than 1.0V.

8) If step 7 is OK, perform TROUBLE DIAGNOSES FOR DTC P0400, P0402 and P1400. (See pages EC-177, 185 and 254.)

Vacuum Cut Valve Bypass Valve (DTC: 0801)

The vacuum cut valve and vacuum cut valve bypass valve are installed in parallel on the EVAP purge line between the fuel tank and the EVAP canister.

The vacuum cut valve prevents the intake manifold vacuum from being applied to the fuel tank.

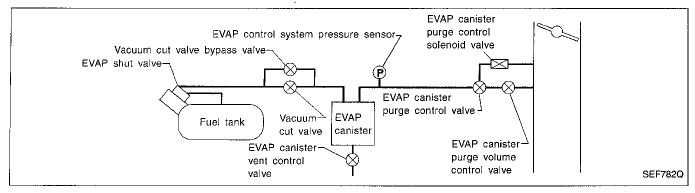

The vacuum cut valve bypass valve is a solenoid type valve and generally remains closed. It opens only for on board diagnosis.

The vacuum cut valve bypass valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the valve is opened. The vacuum cut valve is then bypassed to apply intake manifold vacuum to the fuel tank.

Evaporative Emission (EVAP) Canister Purge Volume Control Valve (DTC: 1008)

SYSTEM DESCRIPTION

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control valve changes to control the flow rate. A built-in step motor moves the valve in steps corresponding to the ECM output pulses. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

COMPONENT DESCRIPTION

The EVAP canister purge volume control valve uses a step motor to control the flow rate of fuel vapor from the EVAP canister. This motor has four winding phases. It operates according to the output pulse signal of the ECM. Two windings are turned ON and OFF in sequence. Each time an ON pulse is issued, the valve opens or closes, changing the flow rate. When no change in the flow rate is needed, the ECM does not issue the pulse signal. A certain voltage signal is issued so that the valve remains at that particular opening.

Evaporative Emission (EVAP) Control System Purge Flow Monitoring (DTC: 0111)

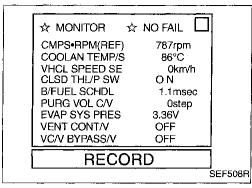

SYSTEM DESCRIPTION

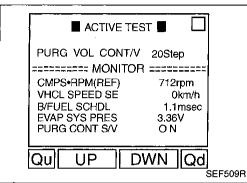

In this evaporative emission (EVAP) control system, purge flow occurs during non-closed throttle conditions. Purge volume is related to air intake volume. Under normal purge conditions (non-closed throttle), the EVAP canister purge volume control valve and EVAP canister purge control valve are open. Purge flow exposes the EVAP control system pressure sensor to intake manifold vacuum.

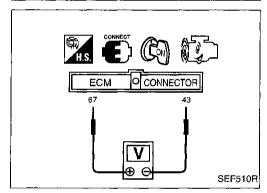

ON BOARD DIAGNOSIS LOGIC

Under normal conditions (non-closed throttle), sensor output voltage indicates if pressure drop and purge flow are adequate. If not, a fault is determined.

Diagnostic Trouble Code No.	Malfunction is detected when	Check Items (Possible Cause)
P1447 0111	EVAP control system does not operate properly. EVAP control system has a leak between intake manifold and EVAP control system pressure sensor.	EVAP canister purge volume control valve stuck closed EVAP canister purge control valve stuck closed EVAP control system pressure sensor Loose or disconnected rubber tube Blocked rubber tube EVAP canister purge control solenoid valve Blocked or bent rubber tube to MAP/BARO switch solenoid valve Cracked EVAP canister Absolute pressure sensor MAP/BARO switch solenoid valve

Evaporative Emission (EVAP) Control System Purge Flow Monitoring (DTC: 0111) (Cont'd)

OVERALL FUNCTION CHECK

Use this procedure to check the overall monitoring function of the EVAP control system purge flow. During this check, a DTC might not be confirmed.

1) Lift up drive wheels (M/T models).

2) Start engine.

 Select "EVAP SYS PRES" in "DATA MONITOR" mode with CONSULT.

4) Check EVAP control system pressure sensor value at idle speed.

5) Select "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT and set "PURG VOL CONT/V" to 20 steps by touching "UP" or "Qu".

6) Maintain the following conditions for at least 30 seconds. Verify that EVAP control system pressure sensor value ("EVAP SYS PRES") stays 0.1V less than the value at idle speed for at least 2 seconds.

Engine speed:

Approx. 2,000 rpm

Gear position (for M/T models):

Any position other than "Neutral" or "Reverse"

CAUTION:

Do not run vehicle at speeds greater than 80 km/h (50 MPH).

Lift up drive wheels.
 Start engine and wa

) Start engine and warm it up sufficiently.

3) Turn ignition switch "OFF", wait at least 5 seconds.

- OR -

4) Start engine and wait at least 70 seconds.

5) Set voltmeter probes to ECM terminals 67 (EVAP control system pressure sensor signal) and 43 (ground).

6) Check EVAP control system pressure sensor value at idle speed.

7) Establish and maintain the following conditions for at least 30 seconds.

Air conditioner switch: ON Steering wheel: Fully turned

Headlamp switch: ON

Rear window defogger switch: ON Engine speed: Approx. 3,500 rpm

Intake manifold vacuum:

-73.3 to -60.0 kPa (-550 to -450 mmHg,

-21.65 to -17.72 inHg, -10.63 to -8.70 psi)

Gear position: M/T models

Any position other than "Neutral" or "Reverse" A/T models

Any position other than "P", "N" or "R".

Return all conditions to normal. Repeat this procedure at least 5 times.

Verify that EVAP control system pressure sensor value stays 0.1V less than the value at idle speed for at least 2 seconds.

CAUTION:

Do not run vehicle at speeds greater than 80 km/h (50 MPH).

terminal 5 and terminals 4, 6

Resistance:

Approximately 30Ω [At 25°C (77°F)]

- Reconnect EVAP canister purge volume control valve harness connector.
- 4) Remove EVAP canister purge volume control valve from intake manifold collector and disconnect hoses from the valve.

(Plug the purge hoses. The EVAP canister purge volume control valve harness connector should remain connected.)

- 5) Turn ignition switch "ON".
- 6) Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode with CONSULT. Check that EVAP canister purge volume control valve shaft moves smoothly forward and backward according to the valve opening. If NG, replace the EVAP canister purge volume control

- 1) Disconnect EVAP canister purge volume control valve harness connector.
- 2) Check resistance between the following terminals. terminal ② and terminals ①, ③ terminal ⑤ and terminals ④, ⑥

- OR -

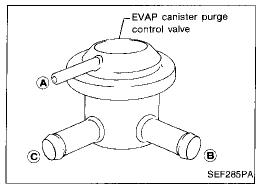

Resistance:

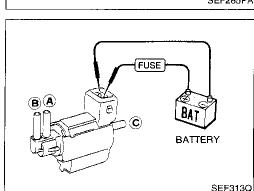

valve.

Approximately 30\Omega [At 25°C (77°F)]

- Reconnect EVAP canister purge volume control valve harness connector.
- 4) Remove EVAP canister purge volume control valve from intake manifold collector and disconnect hoses from the valve.
 - (Plug the purge hoses. The EVAP canister purge volume control valve harness connector should remain connected.)
- 5) Turn ignition switch "ON" and "OFF". Check that EVAP canister purge volume control valve shaft moves smoothly forward and backward according to the ignition switch position.

If NG, replace the EVAP canister purge volume control valve.

Evaporative Emission (EVAP) Control System Purge Flow Monitoring (DTC: 0111) (Cont'd)

EVAP canister purge control valve

 Blow air in port (A), (B) and (C), and check that there is no leakage.

2. Apply vacuum to port (a) with pump. [Approximately -13.3 to -20.0 kPa (-100 to -150 mmHg, -3.94 to -5.91 inHg, -1.93 to -2.90 psi)]

Blow air in port © and check that it flows freely out of port B.

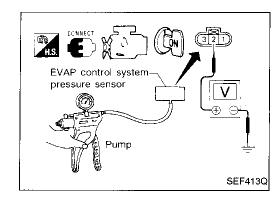

EVAP canister purge control solenoid valve

Check EVAP canister purge control valve as follows:

Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals	Yes	No
No supply	No	Yes

If NG, replace solenoid valve.

EVAP control system pressure sensor

- Remove EVAP control system pressure sensor with its harness connector connected.
- 2. Remove hose from EVAP control system pressure sensor.
- Use pump to apply vacuum and pressure to EVAP control system pressure sensor as shown in figure.
- 4. Check output voltage between terminal 2 and engine ground.

Pressure (Relative to atmospheric pressure)	Voltage (V)
0 kPa (0 mmHg, 0 inHg, 0 psi)	3.0 - 3.6
-9.3 kPa (-70 mmHg, -2.76 inHg, -1.35 psi)	0.4 - 0.6

CAUTION:

EC-279

Always calibrate the vacuum pump gauge when using it.

5. If NG, replace EVAP control system pressure sensor.

Evaporative Emission (EVAP) Control System Purge Flow Monitoring (DTC: 0111) (Cont'd)

Absolute pressure sensor

- Remove absolute pressure sensor with its harness connector connected.
- 2. Remove hose from absolute pressure sensor.
- 3. Turn ignition switch "ON" and check output voltage between terminal ② and engine ground.

The voltage should be 3.2 to 4.8 V.

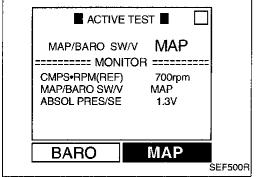

4. Use pump to apply vacuum of -26.7 kPa (-200 mmHg, -7.87 inHg, -3.87 psi) to absolute pressure sensor as shown in figure and check the output voltage.

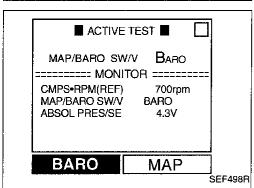

The voltage should be 1.0 to 1.4 V lower than the value measured in step 3.

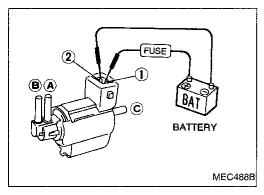

CAUTION:

Always calibrate the vacuum pump gauge when using it.

5. If NG, replace absolute pressure sensor.

MAP/BARO switch solenoid valve

- 1. Start engine and warm it up sufficiently.
- 2. Perform "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
- Check the following.
 - When "MAP" is selected, "ABSOL PRES/SE" indicates approximately 1.3V.
 - When "BARO" is selected, "ABSOL PRES/SE" indicates approximately 4.3V.
- 4. If NG, replace solenoid valve.

1. Remove MAP/BARO switch solenoid valve.

OR

2. Check air passage continuity.

Condition	Air passage continuity between (A) and (B)	Air passage continuity between (A) and (C)
12V direct current supply between terminals (1) and (2)	Yes	No
No supply	No	Yes

3. If NG, replace solenoid valve.

A/T Diagnosis Communication line (DTC: 0804)

The malfunction information related to A/T (Automatic Transmission) is transferred through the line (circuit) from A/T control unit to ECM. Therefore, be sure to erase the malfunction information such as DTC not only in A/T control unit but also ECM after the A/T related repair.

\mathbb{G}

Diagnostic Trouble Code No.	Malfunction is detected when	Check Item (Possible Cause)	MA
P1605 0804	An incorrect signal from A/T control units is sent to ECM.	Harness or connectors (The communication line circuit between ECM and A/T	EM
		control unit is open or shorted.) • Dead (Weak) battery • A/T control unit	LC

DIAGNOSTIC TROUBLE CODE CONFIRMATION **PROCEDURE**

Note: Before performing the following procedure, confirm that battery voltage is more than 10.5V.

EC

- Turn ignition switch "ON".
- Select "DATA MONITOR" mode with CONSULT.

- OR -

3) Start engine and let it idle for at least 40 seconds.

CL.

MT

- Turn ignition switch "ON".
- Start engine and let it idle for at least 40 seconds.

Cooling Fan (DTC: 1308)

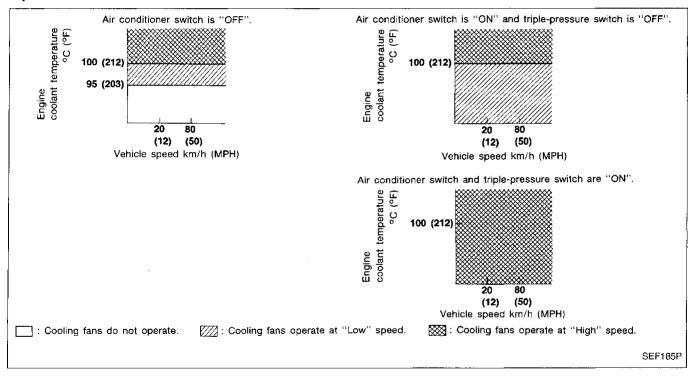

SYSTEM DESCRIPTION

Cooling fan control

The ECM controls the cooling fan corresponding to the vehicle speed, engine coolant temperature, air conditioner system pressure and air conditioner ON signal. The control system has 3-step control [HIGH/LOW/OFF].

Operation

Cooling Fan (DTC: 1308) (Cont'd)

ON BOARD DIAGNOSIS LOGIC

Diagnostic trouble

code No.

This diagnosis continuously monitors the engine coolant temperature.

If the cooling fan or another component in the cooling system malfunctions, the engine coolant temperature

When the engine coolant temperature reaches an abnormally high temperature condition, a malfunction is indicated.

Malfunction is detected when	Check Items (Possible Cause)	MA
 Cooling fan does not operate properly (Overheat). Cooling fan system does not operate properly (Overheat). Engine coolant was not added to the system using 	Harness or connectors. (The cooling fan circuit is open or shorted.) Cooling fan Radiator hose	- EM
the proper filling method.	Radiator Radiator Radiator cap Water pump	LG
	Thermostat For more information, refer to "MAIN 12 CAUSES OF OVERHEATING", (EC-294).	EC

CAUTION:

P1900

1308

When a malfunction is indicated, be sure to replace the coolant following the procedure in the MA section ("Changing Engine Coolant", "ENGINE MAINTENANCE"). Also, replace the engine oil.

- a. Fill radiator with coolant up to specified level with a filling speed of 2 liters per minute like pouring coolant by kettle. Be sure to use coolant with the proper mixture ratio. Refer to MA section ("Anti-freeze Coolant Mixture Ratio", "RECOMMENDED FLUIDS AND LUBRICANTS").
- b. After refilling coolant, run engine to ensure that no water-flow noise is emitted.

Cooling Fan (DTC: 1308) (Cont'd) OVERALL FUNCTION CHECK

Use this procedure to check the overall function of the cooling fan. During this check, a DTC might not be confirmed.

WARNING:

Never remove the radiator cap when the engine is hot. Serious burns could be caused by high pressure fluid escaping from the radiator.

Wrap a thick cloth around cap. Carefully remove the cap by turning it a quarter turn to allow built-up pressure to escape. Then turn the cap all the way off.

- Check the coolant level in the reservoir tank and radiator.
 Allow engine to cool before checking coolant level.
 If the coolant level in the reservoir tank and/or radiator is below the proper range, skip the following steps and go to "DIAGNOSTIC PROCEDURE" (EC-288).
- Confirm whether customer filled the coolant or not. If customer filled the coolant, skip the following steps and go to "DIAG-NOSTIC PROCEDURE" (EC-288).
 - 3) Turn ignition switch "ON".
 - 4) Perform "COOLING FAN" in "ACTIVE TEST" mode with CONSULT (LOW speed and HI speed).

Start engine.

Be careful not to overheat engine.

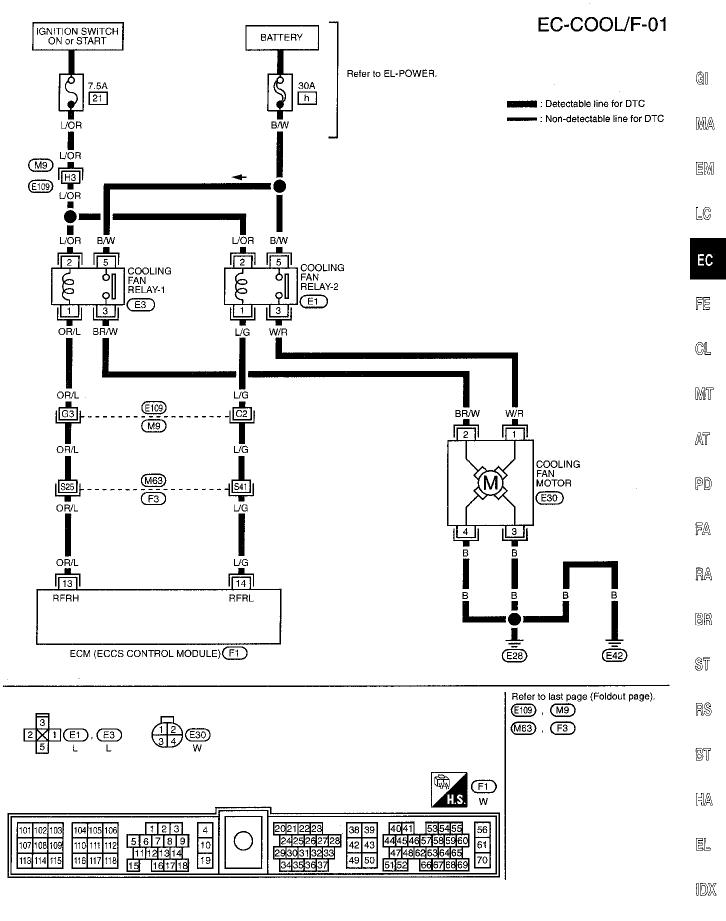

- 4) Set temperature control lever to full cold position.
- 5) Turn air conditioner switch "ON".
- 6) Turn blower fan switch "ON".
- 7) Run engine at idle for a few minutes with air conditioner operating.

Be careful not to overheat engine.

- Make sure that cooling fan operates at low speed.
- 9) Turn ignition switch "OFF".
- 10) Turn air conditioner switch and blower fan switch "OFF".
- 11) Disconnect engine coolant temperature sensor harness connector.
- 12) Connect 150 Ω resistor to engine coolant temperature sensor harness connector.
- 13) Restart engine and make sure that cooling fan operates at higher speed than low speed.

Be careful not to overheat engine.

DIAGNOSTIC PROCEDURE

ground with CONSULT or tester.

OK

(A)

Voltage: Battery voltage

The fuel injector is a small, precise solenoid valve. When the ECM supplies a ground to the injector circuit, the coil in the injector is energized. The energized coil pulls the needle valve back and allows fuel to flow through the injector into the intake manifold. The amount of fuel injected depends upon the injection pulse duration. Pulse duration is the length of time the injector remains open. The ECM controls the injection pulse duration based on engine fuel needs.

Fuel Pump

SYSTEM DESCRIPTION

The ECM activates the fuel pump for several seconds after the ignition switch is turned on to improve engine startability. If the ECM receives a 180° signal from the camshaft position sensor, it knows that the engine is rotating, and causes the pump to perform. If the 180° signal is not received when the ignition switch is on, the engine stalls. The ECM stops pump operation and prevents battery discharging, thereby improving safety. The ECM does not directly drive the fuel pump. It controls the ON/OFF fuel pump relay, which in turn controls the fuel pump.

Condition	Fuel pump operation
Ignition switch is turned to ON.	Operates for 1 second
Engine running and cranking	Operates
When engine is stopped	Stops in 1 second
Except as shown above	Stops

If NG, replace power steering oil pressure switch.

IACV-Air Regulator

EC-AIRREG-01

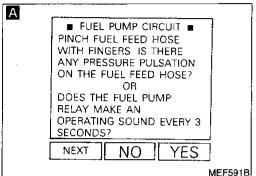

G

Air flow Terminal O-ring

IACV-Air Regulator (Cont'd) DESCRIPTION

The idle air control valve (IACV)-air regulator provides an air bypass when the engine is cold for a fast idle during warm-up. A bimetal, heater and rotary shutter are built into the IACV-air regulator. When the bimetal temperature is low, the air by-pass port opens. As the engine starts and electric current flows through a heater, the bimetal begins to turn the shutter to close the by-pass port. The air passage remains closed until the engine stops and the bimetal temperature drops.

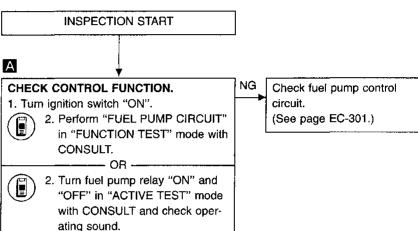

DIAGNOSTIC PROCEDURE

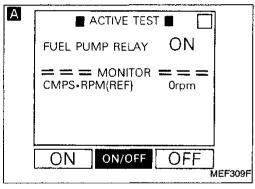

- OR -

 Pinch fuel feed hose with fingers.
 Fuel pressure pulsation should be felt on the fuel feed hose for 5 seconds after ignition switch is turned "ON".

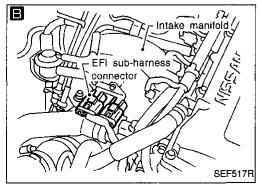

OK

*2: These are prescribed by SAE J2012.

SERVICE DATA AND SPECIFICATIONS (SDS)

General Specifications

FUEL PRESSURE REGULATOR	
Fuel pressure at idling kPa (kg/cm², psi)	
Vacuum hose is connected	Approximately 235 (2.4, 34)
Vacuum hose is disconnected	Approximately 294 (3.0, 43)

(G)

MA

Inspection and Adjustment EGR TEMPERATURE SENSOR

Idle speed*1 rpm	
No-load*2 (in "N" position)	700±50
Air conditioner: ON (in "N" position)	1,000 or more
Ignition timing	20°±2° BTDC
Throttle position sensor idle position V	0.3 - 0.7

EGR temperature °C (°F)	Voltage (V)	Resistance (MΩ)
0 (32)	4.81	7.9 - 9.7
50 (122)	2.82	0.57 - 0.70
100 (212)	0.8	0.08 - 0.10

[_C

*1: Feedback controlled and needs no adjustments

- *2: Under the following conditions:
 - · Air conditioner switch: OFF
 - · Electric load: OFF (Lights, heater, fan & rear defogger)

FUEL PUMP

Resistance [at 25°C (77°F)]	Ω	0.2 - 5.0
-----------------------------	---	-----------

MT

IGNITION COIL

Primary voltage	٧	Battery voltage (11 - 14)
Primary resistance [at 20°C (68°F)]	Ω	Approximately 1.0
Secondary resistance [at 20°C (68°F)]	kΩ	Approximately 26.0

IACV-AAC VALVE

Resistance [at 25°C (77°F)]

Resistance [at 25°C (77°F)]	Ω	Approximately 10.0

PD

MASS AIR FLOW SENSOR

Supply voltage	٧	Battery voltage (11 - 14)
Output voltage	٧	1.3 - 1.7
Mass air flow	gm/sec	1.5 - 4.5 at idle* 6.0 - 14.0 at 2,500 rpm*

RESISTOR

INJECTOR

10 - 14

RA

BR

FA

THROTTLE POSITION SENSOR

Accelerator pedal conditions	Resistance [at 25°C (77°F)]
Completely released	Approximately 0.5 kΩ
Partially released	0.5 - 4.0 kΩ
Completely depressed	Approximately 4.0 kΩ

ST
